# Texas Commission on Environmental Quality

## Permit or Registration Application for Municipal Solid Waste Facility

### Part I

**A. General Information**

| | | | | |
|---|---|---|---|---|
| Facility Name: | McCombs Municipal Landfill | | | |
| Physical or Street Address (if available): | 13660 McCombs | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79924 |
| (Area Code) Telephone Number: | 915-621-6700 | | | |
| Charter Number: | | | | |

If the application is submitted on behalf of a corporation, provide the Charter Number as recorded with the Office of the Secretary of State for Texas.

| | | | | |
|---|---|---|---|---|
| Operator Name[1]: | City of El Paso | | | |
| Mailing Address: | 7968 San Paulo Dr. | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79907 |
| (Area Code) Telephone Number: | 915-621-6700 | | | |
| (Area Code) FAX Number: | 915-621-6711 | | | |
| Charter Number: | | | | |

If the permittee is the same as the operator, type "Same as Operator".

| | | | | |
|---|---|---|---|---|
| Permittee Name: | Same as Operator | | | |
| Physical or Street Address (if available): | | | | |
| (City) (County)( State)( Zip Code): | | | TX | |
| (Area Code) Telephone Number: | | | | |
| Charter Number: | | | | |

If the application is submitted by a corporation or by a person residing out of state, the applicant must register an Agent in Service or Agent of Service with the Texas Secretary of State's office and provide a complete mailing address for the agent. The agent must be a Texas resident.

| | | | | |
|---|---|---|---|---|
| Agent Name: | | | | |
| Mailing Address: | | | | |
| (City) (County)( State)( Zip Code): | | | | |
| (Area Code) Telephone Number: | | | | |
| (Area Code) FAX Number: | | | | |

Application Type:

| | | | | | |
|---|---|---|---|---|---|
| ☐ | Permit | ☒ | Major Amendment | ☐ | Minor Amendment |
| ☐ | Registration | ☐ | Modification | ☐ | Temporary Authorization |
| | | ☒ | w/Public Notice | | |
| | | ☐ | w/out Public Notice | ☐ | Notice of Deficiency Response |

[1] The operator has the duty to submit an application if the facility is owned by one person and operated by another [30 TAC 305.43(b)]. The permit will specify the operator and the owner who is listed on this application [Section 361.087 Texas Health and Safety Code].

Facility Classification:

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ☒ | Type I | ☐ | Type IV | ☐ | Type V | ☐ | Type IX |
| ☐ | Type I AE | ☐ | Type IV AE | ☐ | Type VI | | |

Activities covered by this application (check all that apply):

| | | | | | |
|---|---|---|---|---|---|
| ☐ | Storage | ☐ | Processing | ☒ | Disposal |

Waste management units covered by this application (check all that apply):

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ☐ | Containers | ☐ | Tanks | ☐ | Surface Impoundments | ☒ | Landfills |
| ☐ | Incinerators | ☐ | Composting | ☐ | Type IV Demonstration Unit | ☐ | Type IX Energy/Material Recovery |
| ☐ | Other (Specify) | | | ☐ | Other (Specify) | | |
| ☐ | Other (Specify) | | | ☐ | Other (Specify) | | |

Is this submittal part of a Consolidated Permit Processing request, in accordance with 30 TAC Chapter 33?

☐ Yes ☒ No

**If yes**, state the other TCEQ program authorizations requested.

Provide a brief description of the portion of the facility covered by this application. For amendments, modifications, and temporary authorizations, provide a brief description of the exact changes to the permit or registration conditions and supporting documents referenced by the permit or registration. Also, provide an explanation of why the amendment, modification, or temporary authorization is requested.

This Major Permit Amendment application is for a vertical expansion to the existing McCombs Landfill owned and operated by the City of El Paso as well as a property size increase to 347-acres to account for the site entrance facilities. It should be noted that there is not an increase to the waste boundary. This amendment is requested to allow the City of El Paso to have adequate capacity for future solid waste disposal needs.

Does the application contain confidential Material? ☐ Yes ☒ No

If yes, cross-reference the confidential material *throughout the application* and submit as a separate document or binder conspicuously marked "CONFIDENTIAL."

Alternative Language Notice Instructions

For certain permit applications, public notice in an alternate language is required. If an elementary school or middle school nearest to the facility offers a bilingual program, notice may be required to be published in an alternative language. The Texas Education Code, upon which the TCEQ alternative language notice requirements are based, trigger a bilingual education program to apply to an entire school district should the requisite alternative language speaking student population exist. However, there may not exist any bilingual students at a particular school within a district which is required to offer the bilingual education program. For this reason, the requirement to publish notice in an alternative language is triggered if the nearest elementary or middle school, as a part of a larger school district, is required to make a bilingual education program available to qualifying students and either the school has students enrolled at such a program on-site, or has students who attend such a program at another location in satisfaction of the school's obligation to provide such a program as a member of a triggered district.

If it is determined that an alternative language notice is required, the applicant is responsible for ensuring that the publication in the alternate language is complete and accurate in that language. Electronic versions of the Spanish template examples are available from the TCEQ to help the applicant complete

the publication in the alternative language.

Alternative Language Notice Application Form:

Alternative language notice confirmation for this application:

1. Is a bilingual program required by the Texas Education Code in the school district where the facility is located? ☒ YES ☐ NO

   (If NO, alternative language notice publication not required)

2. If YES to question 1, are students enrolled in a bilingual education program at either the elementary school or the middle school nearest to the facility? ☒ YES ☐ NO

(IF YES to questions 1 and 2, alternative language publication is required; If NO to question 2, then consider the next question)

3. If YES to question 1, are there students enrolled at either the elementary school or the middle school nearest to the facility who attend a bilingual education program at another location? ☐ YES ☐ NO

(If Yes to questions 1 and 3, alternative language publication is required; If NO to question 3, then consider the next question)

4. If YES to question 1, would either the elementary school or the middle school nearest to the facility be required to provide a bilingual education program but for the fact that it secured a waiver from this requirement, as available under 19 TAC '89.1205(g)?
   ☐ YES ☐ NO

(If Yes to questions 1 and 4, alternative language publication is required; If NO to question 4, alternative language notice publication not required)

If a bilingual education program(s) is provided by either the elementary school or the middle school nearest to the facility, which language(s) is required by the bilingual program?

Note: Applicants for new permits and major amendments must make a copy of the administratively complete application available at a public place in the county where the facility is, or will be, located for review and copying by the public.

| Public place where administratively complete permit application will be located. | | | | |
|---|---|---|---|---|
| Public Place (e.g., public library, county court house, city hall, etc.): | El Paso Municipal Service Center (MSC) | | | |
| Mailing Address: | 7968 San Paulo Dr. | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79907 |
| (Area Code) Telephone Number: | 915-621-6700 | | | |

## B. Facility Location

| Except for Type I AE and Type IV AE landfill facilities, for permits, registrations, amendments, and modifications requiring public notice, provide the URL address of a publicly accessible internet web site where the application and all revisions to that application will be posted. |
|---|
| http://home.elpasotexas.gov/environmental-services/landfill.php |

| | |
|---|---|
| Local Government Jurisdiction: | City of El Paso |
| Within City Limits of: | City of El Paso |
| Within Extraterritorial Jurisdiction of City of: | |
| Is the proposed municipal or industrial solid waste disposal or processing facility located in an area in which the governing body of the municipality or county has prohibited the disposal or processing of municipal or industrial solid waste? (If YES, provide a copy of the ordinance or order): | |
| ☐ YES ☒ NO | |

| Provide a description of the location of the facility with respect to known or easily identifiable landmarks. |
|---|
| Northeast of the intersection of McCombs Road and Stan Roberts Road (FM 2529) in El Paso, Texas. |

| Detail the access routes from the nearest United States or state highway to the facility. |
|---|
| 4.4 miles west on McCombs Road from US 54 North |

Provide the latitudinal and longitudinal geographic coordinates of the facility.

| | |
|---|---|
| Latitude | **N 31 deg. 59' 15"** |
| Longitude | **W 106 deg. 24' 19"** |
| Elevation (above msl) | Approximately 4070' near existing entrance |

| | |
|---|---|
| Is the facility within the Coastal Management Program boundary? | ☐ Yes ☒ No |

Texas Department of Transportation District Location:

| | | | | |
|---|---|---|---|---|
| TXDOT District Name & Number: | El Paso | | | |
| District Engineer's Name: | Robert Bielek, DPA, P.E. | | | |
| Street or P. O. Box: | 13301 Gateway West | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79928 |
| (Area Code) Telephone Number: | 915-790-4203 | | | |
| (Area Code) FAX Number: | 915-790-4311 | | | |

The local governmental authority or agency responsible for road maintenance:

| | | | | |
|---|---|---|---|---|
| Agency Name | Department of Transportation, City of El Paso | | | |
| Contact Person's Name: | Ted Marquez (Interim Engineer) | | | |
| Street or P. O. Box: | 7968 San Paulo Drive | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79907 |
| (Area Code) Telephone Number: | 915-621-6750 | | | |
| (Area Code) FAX Number: | 915-621-6772 | | | |

State Representative:

| | | | | |
|---|---|---|---|---|
| District Number: | 79 | | | |
| State Representative's Name: | Representative Joe C. Pickett | | | |
| District Office Address: | 1790 Lee Trevino #307 | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79936 |
| (Area Code) Telephone Number: | 915-590-4349 | | | |
| (Area Code) FAX Number: | 915-590-4726 | | | |

State Senator:

| | | | | |
|---|---|---|---|---|
| District Number: | 29 | | | |
| State Senator's Name: | Senator José Rodríguez | | | |
| District Office Address: | 100 N. Ochoa, Suite A | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79901 |
| (Area Code) Telephone Number: | 915-351-3500 | | | |
| (Area Code) FAX Number: | 915-351-3579 | | | |

Council of Government (COG) Information:

| | | | | |
|---|---|---|---|---|
| COG Name: | Rio Grande Council of Governments | | | |
| COG Representative's Name: | Annette Gutierrez | | | |
| COG Representative's Title: | Executive Director | | | |
| Street or P. O. Box: | 1100 N. Stanton Street, Suite 610 | | | |
| (City) (County)( State)( Zip Code): | El Paso | El Paso | TX | 79902 |
| (Area Code) Telephone Number: | 915-533-0998 | | | |
| (Area Code) FAX Number: | 915-532-9385 | | | |

River Basin Information:

| This site is located in the following District of the U.S. Army Corps of Engineers: | | | |
|---|---|---|---|
| ☒ Albuquerque, NM | ☐ Ft. Worth, TX | ☐ Galveston, TX | ☐ Tulsa, OK |

## C. Maps

General **(See Part I – Section 1.3)**

For permits, registrations, and amendments only, submit a topographic map, ownership map, county highway map, or a map prepared by a registered professional engineer or a registered surveyor which shows the facility and each of its intake and discharge structures and any other structure or location regarding the regulated facility and associated activities. Maps must be of material suitable for a permanent record, and shall be on sheets 8-1/2 inches by 14 inches or folded to that size, and shall be on a scale of not less than one inch equals one mile. The map shall depict the approximate boundaries of the tract of land owned or to be used by the applicant and shall extend at least one mile beyond the tract boundaries sufficient to show the following:

each well, spring, and surface water body or other water in the state within the map area;

the general character of the areas adjacent to the facility, including public roads, towns and the nature of development of adjacent lands such as residential, commercial, agricultural, recreational, undeveloped, etc;

the location of any waste disposal activities conducted on the tract not included in the application; and

the ownership of tracts of land adjacent to the facility and within a reasonable distance from the proposed point or points of discharge, deposit, injection, or other place of disposal or activity.

General location maps **(See Part I – Section 1.3)**

For permits, registrations, and amendments only, submit at least one general location map at a scale of one-half inch equals one mile. This map shall be all or a portion of a county map prepared by Texas Department of Transportation (TxDOT). If TxDOT publishes more detailed maps of the proposed facility area, the more detailed maps shall also be included in Part I. Use the latest revision of all maps.

Land ownership map **(See Part I – Section 1.3)**

Provide a map that locates the property owned by adjacent and potentially affected landowners. The maps should show all property ownership within 1/4 mile of the facility, on-site facility easement holders, and all mineral interest ownership under the facility.

Landowners list **(See Part I – Section 1.3)**

Provide the adjacent and potentially affected landowners' list, keyed to the land ownership map with each property owner's name and mailing address. The list shall include all property owners within 1/4 mile of the facility, easement holders, and all mineral interest ownership under the facility. Provide the property, easement holders', and mineral interest owners' names and mailing addresses derived from the real property appraisal records as listed on the date that the application is filed. Provide the list in electronic form, as well.

## D. Property owner information

For permits, registrations, amendments, and modifications that change the legal description, a change in owner, or a change in operator only, provide the following:

(1) the legal description of the facility; **(See Part I – Section 1.4)**

- (A) the abstract number as maintained by the Texas General Land Office for the surveyed tract of land;
- (B) the legal description of the property and the county, book, and page number or other generally accepted identifying reference of the current ownership record;
- (C) for property that is platted, the county, book, and page number or other generally accepted identifying reference of the final plat record that includes the acreage encompassed in the application and a copy of the final plat, in addition to a written legal description;
- (D) a boundary metes and bounds description of the facility signed and sealed by a registered professional land surveyor;
- (E) on-site easements at the facility, and
- (F) drawings of the boundary metes and bounds description; and

(2) a property owner affidavit signed by the owner. **(See Part 9 of Part 1 Form 0650)**

## E. Legal authority

Provide verification of the legal status of the owner and operator, such as a one-page certificate of incorporation issued by the secretary of state. List all persons having over a 20% ownership in the proposed facility. **(See Part I – Section 1.5)**

| Indicate Ownership status of the facility: | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| ☐ | Private | ☐ | Corporation | ☐ | Partnership | ☐ | Proprietorship | ☐ | Non-Profit Organization |
| ☐ | Public | ☐ | Federal | ☐ | Military | ☐ | State | ☐ | Regional |
| ☐ | County | ☒ | Municipal | ☐ | Other (Specify) | | | | |

| Does the operator own the facility units and the facility property? | ☒ Yes ☐ No |
|---|---|

| If "No," for permits, registrations, amendments, and modifications that changes the legal description, a change in owner, or a change in operators submit a copy of the lease for the use of or the option to buy the facility units or facility property, as appropriate, and identify: | |
|---|---|
| Owner Name: | |
| Street or P. O. Box: | |
| (City) (County)( State)( Zip Code): | |
| (Area Code) Telephone Number: | |
| (Area Code) FAX Number: | |
| Charter Number: | |

## F. Evidence of competency

| For permits, registrations, amendments, and modifications that change the legal description, a change in owner, or a change in operators submit a list of all Texas solid waste sites that the owner and operator have owned or operated within the last ten years. | | | | |
|---|---|---|---|---|
| Site Name | Site Type | Permit/Reg. No. | County | Dates of Operation |
| **See Part I – Section 1.6** | | | | |

| Submit a list of all solid waste sites in all states, territories, or countries in which the owner and operator have a direct financial interest. | | | |
|---|---|---|---|
| Site Name | Location | Dates of Operation | Regulatory Agency (Name & Address) |
| **See Part I – Section 1.6** | | | |

A licensed solid waste facility supervisor, as defined in 30 TAC Chapter 30, Occupational Licenses and Registrations will be employed before commencing facility operation.

| Provide the names of the principals and supervisors of the owner's and operator's organization, together with previous affiliations with other organizations engaged in solid waste activities. | | |
|---|---|---|
| Name | Previous Affiliation | Other Organization |
| **See Part I – Section 1.6** | | |

For landfill permit applications only, evidence of competency to operate the facility shall also include landfilling and earthmoving experience if applicable, and other pertinent experience, or licenses as described in 30 TAC Chapter 30 possessed by key personnel. The number and size of each type of equipment to be dedicated to facility operation will be specified in greater detail on Part IV of the application within the site operating plan.

| Landfilling/Earthmoving Equipment Types | Personnel Experience or Licenses |
|---|---|
| **See Part I – Section 1.6** | |
| | |
| | |

For mobile liquid waste processing units, submit a list of all solid waste, liquid waste, or mobile waste units that the owner and operator have owned or operated within the past five years. Submit a list of any final enforcement orders, court judgments, consent decrees, and criminal convictions of this state and the federal government within the last five years relating to compliance with applicable legal requirements relating to the handling of solid or liquid waste under the jurisdiction of the commission or the United States Environmental Protection Agency. Applicable legal requirement means an environmental law, regulation, permit, order, consent decree, or other requirement.

| Solid waste, liquid waste, or mobile waste units owned or operated within past 5 years | Texas and federal final enforcement orders, court judgments, consent decrees, and criminal convictions |
|---|---|
| **Not Applicable** | |
| | |
| | |

## G. Appointments

Provide documentation that the person signing the application meets the requirements of 30 TAC §305.44, Signatories to Applications. If the authority has been delegated, provide a copy of the document issued by the governing body of the owner or operator authorizing the person that signed the application to act as agent for the owner or operator. **(See Part I – Section 1.7)**

## H. Application Fees

For a new permit, registration, amendment, modification, or temporary authorization, submit a $150 application fee. **(See Part I – Section 1.8)**

For authorization to construct an enclosed structure over an old, closed municipal solid waste landfill in accordance with 30 TAC 330 Subchapter T, submit a $2,500 application fee.

If paying by check, send payment to:

Texas Commission on Environmental Quality
Financial Administration Division, MC 214
P. O. Box 13087
Austin, Texas 78711-3087

| Payment maybe made online using TCEQ e-pay at www.tceq.state.tx.us/e-services/ | |
|---|---|
| E-pay confirmation number | 582EA000111781 |

**PROPERTY OWNER AFFIDAVIT**

"I, KURT FENSTERMACHER,
(property owner)
acknowledge that the State of Texas may hold me either jointly or severally responsible for the operation, maintenance, and closure and post-closure care of the facility. For a facility where waste will remain after closure, I acknowledge that I have a responsibility to file with the county deed records an affidavit to the public advising that the land will be used for a solid waste facility prior to the time that the facility actually begins operating as a municipal solid waste landfill facility, and to file a final recording upon completion of disposal operations and closure of the landfill units in accordance with Title 30 Texas Administrative Code §330.19, Deed Recordation. I further acknowledge that I or the operator and the State of Texas shall have access to the property during the active life and post-closure care period, if required, after closure for the purpose of inspection and maintenance."

## 1.1.1 General

SAIC Energy, Environment and Infrastructure, LLC (SAIC) is pleased to submit this Major Permit Amendment (MPA) application on behalf of the City of El Paso (City) to the Texas Commission on Environmental Quality (TCEQ).

This MPA application is organized into four parts as per the requirements set forth in 30 TAC Chapter 330 Subchapter B. The following describes the contents of the four parts.

- **Part I.** This portion of the MPA application includes information from 30 TAC §281.5, 30 TAC §305.45 and 30 TAC §330.59 relating to the McCombs Landfill (Landfill) and the City, the facility's owner and operator.
- **Part II.** This section contains information regarding the existing conditions at the Landfill to fulfill the requirements of 30 TAC §330.61.
- **Part III.** Part III contains the design data and specifications, analytical reports, and engineering drawings required by 30 TAC §330.63.
- **Part IV.** Part IV includes the Site Operating Plan (SOP) which describes the daily operations at the Landfill as per 30 TAC 30 TAC §330.65.

## 1.1.2 Supplementary Technical Report

The City owns and operates the Type I municipal solid waste disposal facility which is managed under Municipal Solid Waste (MSW) permit 729B. The Landfill is located in El Paso County within the El Paso city limits and serves the waste needs of the City and the surrounding area.

In 2005, the City ceased regular solid waste disposal activities, and the majority of the City's MSW was diverted to the City's Clint Landfill as well as private facilities. During this period, the Landfill was primarily used for the disposal of storm debris and material generated from street cleanings. The City estimates that the Clint Landfill will undergo final closure activities in 2030, and wishes to return the Landfill to full activities to meet immediate and future solid waste disposal needs.

The vertical expansion will increase the height of the Landfill from the previous permitted elevation of 4,125 feet mean sea level (MSL) to 4,305 feet MSL. This corresponds to an increase in capacity of 47,084,981 cubic yards (CY) from a previously permitted volume of 22,348,549 CY to a new permitted volume of 69,433,530 CY.

As described in the site life projections provided in Appendix 3H, the McCombs Landfill is anticipated to receive 3,000 tons per year from 2011 through 2013 (storm debris) and 497,300 tons per year in 2014 increasing at a 2% growth rate throughout

the life of the Landfill. Also, it is assumed that in 2030, the Clint Landfill will reach capacity and the McCombs Landfill will receive all incoming waste (or 1,517,100 tons in 2030). Based on these assumptions, and a 0.60 tons per cubic yard airspace utilization factor, the site capacity is estimated to be consumed in 2059 (when utilizing the prescriptive final cover) or 2060 (when utilizing the alternative final cover). The maximum rate of disposal is estimated to be approximately 2,748,029 tons per year (2060). The Landfill will be utilized following the Sector classifications in that Sector B will follow Sector A, Sector C will follow Sector B, etc.

Also included within this MPA is the disposal of C&D waste on top of the existing unlined landfill, which will act as a surcharge on the waste to enhance settlement prior to piggybacking over the waste with MSW. The C&D waste will be limited to 30-feet of fill, with the remainder of fill needed to reach the MSW base grades be obtained with uncontaminated soil. The C&D waste used for fill within the piggyback liner area will consist of (Class 3 like) inert wastes including (but not limited to) rock/stone, concrete, uncontaminated soil, masonry (brick, stucco and plaster), ceramic items, conduit and pipes, glass, inert plastics, molded fiberglass, and incidental amounts (no more than 5% per load) of metals (including aluminum). Any voids in all inert plastic materials accepted will be removed upon waste compaction. A complete list is provided in Section 2.2.1. It is estimated that based on a 60,000 tons per year disposal rate (2013), 2% growth, and 0.90 tons per cubic yard airspace utilization factor, that the C&D area will reach capacity in 2036.

As per 30 TAC §330.15, the Landfill will not accept hazardous wastes for disposal. These hazardous wastes include lead acid storage batteries, do-it-yourself motor vehicle oil, used oil filters, whole used or scrap tires, refrigerators, freezers, air conditioners, and other items containing chlorinated fluorocarbons (CFCs), bulk or non-containerized liquid waste, regulated hazardous waste as defined in 30 TAC §330.3, polychlorinated biphenyl (PCB) wastes, and radioactive materials. This list is further defined in Section 4.7.1.

The Landfill will accept MSW as defined by 30 TAC §330.3 and some special waste. Special wastes include Class II industrial wastes and municipal commercial waste such as treated medical waste, processed grease/grit trap waste, dead animals, slaughterhouse wastes, and petroleum-product and crude oil contaminated soil. The acceptance of special wastes is further defined in Appendix 4D. Special waste also includes RACM as described below.

The Landfill intends to dispose of regulated asbestos containing material (RACM) as defined in 40 Code of Federal Regulations Part 61 in accordance with 30 TAC §330.171(c)(3). This permit amendment will serve as the notification to the TCEQ of the intent to accept RACM. The procedures for accepting, disposing and recordkeeping are described in further detail in Section 4.9.22. Sector K will be utilized for the disposal of RACM.

This MPA also increases the property/facility area from 327.292 acres to 346.74 acres within Section 6, Block 80, Township 1, Texas and Pacific Railway Survey. An updated metes and bounds is provided in Appendix 1C. It should be noted that the increase is only for the property/facility boundary and the permitted waste footprint size is not increasing.

## 1.2.1 Facility Location and Description

The Landfill is an existing Type 1 MSW disposal facility owned and operated by the City. The Landfill is located at the northeast corner of the intersection of McCombs Road and Stan Roberts Road (FM 2529) in El Paso, Texas. The address of the Landfill is 13660 McCombs Road.

## 1.2.2 Access Routes

The Landfill is accessible through the entrance located on McCombs Road approximately 4.4 miles west of the intersection of McCombs Road with US 54 North. More specific transportation information can be found in Appendix 2C – Transportation Study. Greater detail regarding the location of the Landfill in relation to major thoroughfares can be found in Appendix 1A – General Location Maps.

## 1.2.3 Geographic Coordinates

The latitudinal and longitudinal geographic coordinates of the Landfill are:

- Latitude: N 32° 59’ 15”
- Longitude: W 106° 24’ 19”
- Elevation (above MSL): Approximately 4070’ near existing entrance.

## 1.3.1 General Location Maps

As per the requirements of 30 TAC §330.59(c)(1)-(2) and 30 TAC §305.45 the following maps are included as part of Appendix 1A – General Location Maps:

- General Highway Map for El Paso County;
- Detailed Highway Map for El Paso County; and
- General Topographic Map for the Landfill and Surrounding Area.

All maps updated in the application were completed with the latest information available at the time of development.

## 1.3.2 Land Owner Map and Land Owners List

To meet the requirements of 30 TAC §305.45(a) and 30 TAC §330.59(c)(3), a Land Owner Map and Land Owners List describing parcel ownership within one quarter mile of the Landfill are included in Appendix 1B – Land Ownership Map and Land Owners List.

## 1.4.1 Legal Description

To meet the requirements of 30 TAC §330.59(d)(1), a metes and bounds survey for the Landfill permit boundary is included as Appendix 1C – Legal Description.

## 1.4.2 Property Owner Affidavit

The property owner affidavit has been included in Page 9 of the Part 1 Form 0650 submitted as part of this MPA application.

# Section 1.5
# LEGAL AUTHORITY
30 TAC 330.59(e)

The Landfill is owned and operated by the City of El Paso. No other persons or entities have greater than 20 percent ownership in the Landfill. As per the requirements of 30 TAC §330.59(e), the legal authority of the City has been verified and a copy of the charter filed with the State of Texas is available upon request.

The following evidence of competency has been prepared on behalf of the City to meet the requirements of 30 TAC §330.59(f).

## 1.6.1 Solid Waste Sites

The City has owned/operated several municipal solid waste processing and disposal facilities within the State of Texas. The following is a list of MSW processing and disposal facilities owned/operated by the City.

| Facility Name | Facility Type | Permit Number | County |
|---|---|---|---|
| McCombs Landfill | Type I MSW Landfill | 729A | El Paso |
| Clint Landfill | Type I MSW Landfill | 1482, 2284 | El Paso |
| Delta Transfer Facility | MSW Transfer Station | 728 | El Paso |
| Doniphan HHW Site | HHW Collection and Processing Site | 120017 | El Paso |
| Escobar CCS | Citizens' Collection Station | 120022 | El Paso |
| Harrison CCS | Citizens' Collection Station | 120024 | El Paso |
| Hondo Pass CCS | Citizens' Collection Station | 120018 | El Paso |

The City does not own, operate or have a financial interest in any solid waste sites outside of the State of Texas.

## 1.6.2 Management and Personnel

The management and personnel dedicated to the Landfill are described in Part IV – Site Operating Plan, Section 4.4, Table 4.4-1 (Personnel Types and Descriptions) of this Major Permit Amendment application. A copy of this table has been included in Appendix 1D – Landfill Personnel and Equipment.

## 1.6.3 Equipment Dedicated to McCombs Landfill

The equipment dedicated to the Landfill is described in Part IV – Site Operating Plan, Section 4.4, Table 4.4-2 (Landfill Facility Equipment List) of this Major Permit Amendment application. A copy of this table has been included in Appendix 1D – Landfill Personnel and Equipment.

# Section 1.7
# APPOINTMENTS
30 TAC §330.59(g)

The appointments for this Major Permit Amendment application have been prepared as per the requirements set forth in 30 TAC §330.59(g) and 30 TAC §305.44. Ellen A. Smyth, P.E., Director of Environmental Services for the City of El Paso will act as the designated signatory on behalf of the City. Documentation of SAIC's appointment as the project engineer is provided in Appendix 1E – Engineer's Appointment.

# Section 1.8
# APPLICATION FEES
30 TAC §330.59(h)(1-2)

As per the requirements set forth in TCEQ Part 1 Form 0650, a payment for the amount of $150 has been submitted by the City to the TCEQ Financial Administration division. A receipt of this payment has been included as part of Appendix 1F – Application Fee Documentation.

# Legal Description

SAIC®

Prepared for: City of El Paso
(McCombs Landfill)
October 16, 2012

METES AND BOUNDS

Description of a parcel of land being a portion of Section 6, Block 80, Township 1, Texas and Pacific Railway Company Surveys, City of El Paso, El Paso County, Texas and being more particularly described by metes and bounds as follows:

Commencing for reference at a point marking the common corner of Sections 6 and 7, Block 80 and Sections 1 and 12, Block 81, Township 1, Texas and Pacific Railway Company Surveys from which a point marking the common northerly corner of Section 1, Block 81 and Section 6, Block 80, bears North 02°06'50" East a distance of 5357.59 Feet; Thence along the line between Section 1, Block 81 and Section 6, Block 80, North 02°06'50" East a distance of 620.00 feet to The "TRUE POINT OF BEGINNING"

Thence along said common line, North 02°06'50" East a distance of a distance of 800.00 feet to a point;

Thence leaving said line South 86°43'10" East a distance of 250.00 feet to a point;

Thence, North 02°06'50" East a distance of 406.85 feet to a point;

Thence North 86°43'10" West a distance of 250.00 feet to a point on the common line between Section 1, Block 81, Township 1 and Section 6, Block 80,.Township 1, Texas and Pacific Railway Company Surveys;

Thence along said line, North 02°06'50" East a distance of 3133.27 feet to a point;

Thence leaving said line, South 86°58'10" East a distance of 3312.66 feet to a point;

Thence, South 02°17'50" West a distance of 4299.15 feet to a point;

Thence, North 86°43'13" West a distance of 1028.44 feet to a point;

Thence, South 00°14'23" West a distance of 449.69 feet to a point;

Thence, North 86°52'09" West a distance of 2258.08 feet to a point;

Thence, North 02°33'30" East a distance of 399.85 feet to a point;

Thence, North 86°43'10" West a distance of 30.33 feet to the TRUE POINT OF BEGINNING and containing 14,256,826.83 Square Feet or 327.29 Acres of land more or less.

Note: Not a ground survey, bearings based on survey of 19.442 Acre portion of Section 6, Block 80, Township 1, Texas and Pacific Railway Company Surveys prepared by Robert Seipel Associates, Inc., dated May 4, 2011.

A drawing of even date accompanies this description.

Subject: **Notice of Engineer's Appointment**

Dear Mr. Vickery:

This letter is provided to inform you that the City of El Paso has appointed SAIC as the consulting and design engineers responsible for the Major Permit Amendment for the McCombs Landfill (MSW Permit No. 729A).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

**Ellen A. Smyth, P.E.**

Director of Environmental Services
City of El Paso

MCCOMBS LANDFILL
MAJOR PERMIT AMENDMENT

ABBREVIATIONS AND LEGEND

PROJECT NUMBER: 963150D115
SHT. 2 OF: 78
DRAWING NUMBER: P0-2

Keller, Tonya L. 10/15/2012 11:13:17 AM – P:\00218000 El Paso TX\963150D115\Data Analytical\CAD\P0-2 ABBREVIATIONS AND LEGEND.dwg

## 2.1.1 Existing Conditions Overview

The Landfill is located on approximately 347 acres in rural El Paso County, Texas and serves the greater City of El Paso area. The Landfill was originally permitted in 1976, with subsequent permitting to 327 acres in 1984. This MPA includes the addition of 19.4 acres to include the site entrance facilities within the permitted boundary. The development of the Landfill generally followed the progression of a sand and gravel quarry in that location.

The following summarizes the Landfill's permitting timeline from the TCEQ and its predecessors: Texas Natural Resource Conservation Commission (TNRCC) and the Texas Department of Health (TDH).

- **1976:** Original MSW Permit 729 issued by TDH.
- **1984:** Permit amendment completed to expand acreage from 25 acres to 327 acres. MSW Permit 729A was issued by TDH.
- **1995:** Alternative liner design approved.
- **2002:** Site Development Plan (SDP) permit modification completed.
- **2004:** Closure and post-closure care cost estimates updated.
- **2006:** Site Operating Plan (SOP) updated to comply with current regulations.
- **2009:** Landfill Gas Collection and Control System (GCCS) permit modification completed.
- **2009:** Groundwater Sampling and Analysis Plan permit modification completed.

The Landfill serves the MSW disposal needs of the City of El Paso area. This represents a metropolitan population of 620,456, according to 2009 projections from the United States Census Bureau. The Landfill also accepts waste from neighboring communities in El Paso County, Texas and from Doña Ana County, New Mexico.

As discussed in Section 1.1.2 – Supplementary Technical Report, in 2005, the City ceased regular solid waste disposal activities, and the majority of the City's MSW was diverted to the City's Clint Landfill as well as private facilities. During this period, the Landfill was primarily used for the disposal of storm debris and material generated from street cleanings. The City estimates that the Clint Landfill will undergo final closure activities in 2030, and wishes to return the Landfill to full activities to meet immediate and future solid waste disposal needs. To account for the expected increase in waste, the City developed a vertical expansion of the existing Landfill from 4,125 feet MSL to 4,305 feet MSL to meet their solid waste disposal needs.

## 2.1.2 Permits and Authorizations

The following Table 2.1-1 summarizes the existing permits and authorizations for the Landfill.

Table 2.1-1
Current McCombs Landfill Permits and Authorizations

| Permit Type | Permit Number |
|---|---|
| TCEQ Texas Pollutant Discharge Elimination System (TPDES) Stormwater Permit | TXR05L795 |
| TCEQ Air New Source Permit | 81742 |
| TCEQ Subchapter U: Standard Air Permit | 1749 |
| TCEQ Wastewater General Permit | 2E0000049 |

## 2.1.3 Site-Specific Conditions

In accordance with 30 TAC §330.61(a), a detailed discussion of the site-specific special conditions at the Landfill is included throughout Part II of this MPA application. Items discussed in Section 2.4 through Section 2.10 include the impact on the surrounding area, transportation, general geology and soils, groundwater and surface water, abandoned oil and water wells, floodplains and wetlands, and endangered or threatened species.

There are no existing site-specific conditions that require special design considerations or possible mitigation of conditions.

## 2.2.1 Sources and Characteristics of Waste

The majority of the waste that will be accepted by the Landfill will be classified as MSW (defined in 30 TAC §330.3(88)). MSW accepted in the lined portion of the Landfill will be typically generated from household, residential, commercial, institutional, municipal, manufacturing, industrial, recreational, and construction-demolition sources.

The Landfill also intends to accept construction and demolition (C&D) waste on top of the existing unlined landfill that will consist of (Class 3 like) inert wastes. More specifically, C&D waste will consist of (but is not limited to):

- Rock/stone;
- Concrete;
- Uncontaminated soil;
- Masonry (brick, stucco and plaster);
- Aluminum[1];
- Ceramic items;
- Conduit and pipes (free of asbestos);
- Glass;
- Inert Plastics (any voids in materials accepted will be removed upon waste compaction);
- Molded fiberglass; and
- Metal.[1];

The Landfill will also accept several types of special wastes as described in the Special Waste Acceptance Plan included in Part IV – Site Operating Plan. Acceptable special wastes include Class II industrial waste and municipal commercial waste such as treated medical waste, processed grease/grit trap waste, dead animals, slaughterhouse wastes, and petroleum-product or crude oil contaminated soil. The Landfill also intends to accept regulated asbestos containing material (RACM) as described in Section 4.9.22.

As per 30 TAC §330.15, the Landfill will not accept hazardous wastes for disposal. These hazardous wastes include lead acid storage batteries, do-it-yourself motor vehicle oil, used oil filters, whole used or scrap tires, refrigerators, freezers, air

[1] For C&D material to be used within the area of the piggyback liner profile (referred throughout as Scenario 3), metals (including aluminum) shall be limited to incidental amounts (no more than 5% per load).

conditioners, and other items containing chlorinated fluorocarbons (CFCs), bulk or non-containerized liquid waste, regulated hazardous waste as defined in 30 TAC §330.3, polychlorinated biphenyl (PCB) wastes, and radioactive materials.

Specific information regarding the movement of these wastes through the Landfill is discussed in Section 3.2.2.

## 2.2.2 Projected Waste Acceptance Rates

The Landfill will serve the communities, businesses and institutions in and around the City of El Paso, Texas. The facility ceased regular solid waste disposal activities in 2005 and has only received minimal waste from storm events and street cleanings in the past 5 years. This amounted to approximately 3,785 tons in FY 2010.

The Landfill will continue accepting only minimal waste from 2011 through 2013. Based on research of the current waste stream and conversations with City staff, SAIC estimates that the Landfill may receive approximately 497,309 tons per year (TPY) starting in 2014. In general, this acceptance rate will likely increase over the life of the Landfill due to an expected increase in the population served, but may vary due to conditions in the solid waste market.

The estimated maximum annual waste acceptance rate for the Landfill projected for five years is summarized in Table 2.2-1.

Table 2.2-1
Estimated Maximum Annual Waste Acceptance
(FY 2011 to FY 2015)

| FY | Estimated Maximum Waste Acceptance Rate (Tons) |
|---|---|
| 2011 | 3,000 |
| 2012 | 3,000 |
| 2013 | 3,000 |
| 2014 | 497,309 |
| 2015 | 507,255 |

Once the vertical expansion is approved, the Landfill will have a remaining disposal capacity of approximately 69,433,530 cubic yards (CY) of soil and waste. This will allow the Landfill to have adequate capacity through approximately 2059 or 2060, depending on final cover, assuming that the City's Clint Landfill undergoes closure in the year 2030 and all of the City's MSW disposal needs are met by the McCombs Landfill.

## 2.2.3 Population Equivalent

According to 30 TAC §330.3, the population equivalent is defined as the hypothetical population that would generate an amount of solid waste equivalent to that actually being managed based on a generation rate of five pounds per capita per day and applied to situations involving solid waste not necessarily generated by individuals. It is assumed, for the purpose of this section, that the average volume per ton of waste

entering a municipal solid waste disposal facility is three cubic yards. The projected population equivalent for the Landfill is calculated in Table 2.2-2.

Table 2.2-2
Projected Population Equivalent for McCombs Landfill

| | 2012 | 2020 | 2030 | 2040 |
|---|---|---|---|---|
| Waste Accepted (ton/yr) | 3,000 | 560,050 | 1,517,107 | 1,849,345 |
| Waste Accepted (ton/day)[1] | 8.219 | 1,534 | 4,156 | 5,067 |
| Waste Accepted (lb/day)[2] | 16,438 | 3,068,767 | 8,312,915 | 10,133,397 |
| Population Equivalent[3] | 3,288 | 613,753 | 1,662,583 | 2,026,679 |

1. Assumes waste generation 365 days per year.
2. Assumes 2,000 lb per ton.
3. Assumes per capita generation rate of 5 pounds as per 30 TAC §330.3.

## 2.3.1 General Location Maps

As required by 30 TAC §330.61(c), general location maps have been provided in Appendix 2A - Maps. These maps have been provided in addition to those required by 30 TAC §330.59(c) relating to contents in Part I of the application and present information on the general character of the surrounding land. The required information per 30 TAC §330.61(c) and the information location within the report is summarized below:

> *"1) the prevailing wind direction with a wind rose;"*

The wind rose provided from TCEQ is shown on Drawing P1-3 (Appendix 1A). The wind rose period of record is from 1984 to 1992. The wind rose frequency of occurrence of winds is plotted in the sixteen points of the compass, with a maximum of six wind speed classes for each direction.

> *"2) all known water wells within 500 feet of the proposed permit boundary with the state well numbering system designation for Water Development Board "located wells";"*

Known water wells within 500-feet are provided in Section 2.4.2.

> *"3) all structures and inhabitable buildings within 500 feet of the proposed facility;"*

Three buildings were identified within 500-feet of the facility boundary. These buildings include the CEMEX Quarry office and scale house and site trailers.

> *"4) schools, licensed day-care facilities, churches, hospitals, cemeteries, ponds, lakes, and residential, commercial, and recreational areas within one mile of the facility;"*

Drawing P2-3 provides a land use map for the Landfill within one mile of the facility. Residential, commercial, and recreational areas are shown within this boundary. Table 2.4B-1 also provides a breakdown of the areas within the one mile radius by land use. Additionally, as stated, there are no schools, licensed day-care facilities, churches, hospitals, cemeteries or lakes within one mile of the Landfill. One man-made pond was identified approximately 1,800-feet east of the facility. The pond is part of the CEMEX quarry area for stormwater control and is dry most of the year. It should also be noted that due to ongoing quarry operations, the size, number, and location of man-made ponds may vary at different times during mining operations.

> *"5) the location and surface type of all roads within one mile of the facility that will normally be used by the owner or operator for entering or leaving the facility;"*

The three main roads to be used by the facility (McCombs St, Stan Roberts Sr. Ave, and State Line Drive; locations shown on P2-1) are two-lane asphalt paved roads.

*" 6) latitudes and longitudes;"*

The latitudes and longitudes of the facility are provided on Drawings P2-1 and P2-2.

*"7) area streams;"*

There were not any streams identified within a 1-mile radius of the facility.

*"8) airports within six miles of the facility;"*

Airport locations within the vicinity of the facility are provided in Drawing P2-4.

*"9) the property boundary of the facility;"*

The property boundary is shown on several drawings included in Appendix 2A.

*"10) drainage, pipeline, and utility easements within or adjacent to the facility;"*

Facility easements are provided on Drawing P2-7 and are also discussed in Section 4.9.6.

*"11) facility access control features; and"*

Access to the Landfill is restricted by an existing barbed wire fence located along the perimeter of the facility as well as a locking gate at the facility entrance as depicted on Drawing P2-7.0 and as described in Section 3.2.1.

*"12) archaeological sites, historical sites, and sites with exceptional aesthetic qualities adjacent to the facility."*

As stated in Appendix 2B – Land Use Analysis, Page 2B-3, no archaeologically significant sites, historical sites, or locations of exceptional aesthetic quality were located within one-mile of the Landfill.

## 2.3.2 Facility Layout Maps

Facility layout maps have been provided in Appendix 2A - Maps, as per the requirements set forth in 30 TAC §330.61(d). These maps have been prepared to show the outline of the landfill units, general locations of the main interior facility roadways, locations of monitoring wells, locations of buildings, fencing, natural windbreaks, site entrance roads, and a delineation of the landfill sectors including sequencing of excavation and filling activities.

Existing earthen berms along the western and northern boundaries of the Landfill provide a method of visual screening for the facility.

## 2.3.3 General Topographic Map

Consistent with the regulations set forth in 30 TAC §330.61(e), United States Geologic Survey (USGS) 7 ½ minute quadrangle sheets for El Paso County have been provided to show the topography of the site. This general topographic map is

provided in Appendix 2A – Maps and is shown at a scale of one inch equals 2,000 feet.

## 2.3.4 Aerial Photograph

A series of aerial photographs have been provided in Appendix 2A – Maps as Drawings P2-5 and P2-6. Drawing P2-5 is from an aerial survey completed in February 2011 by Cooper Aerial Surveys Company. This aerial survey was utilized to determine the existing topography at the site. Drawing P2-6 has been provided from Google Earth to meet the requirements set forth in 30 TAC §330.61(f). This aerial photograph has a scale of approximately 1,050 feet equals one inch and shows the area within a one mile radius of the Landfill. This Google Earth image is based on source data from the Texas Ortho Imagery Program and the United States Department of Agriculture (USDA) from April 1, 2008 to June 13, 2010.

## 2.3.5 Land Use Map

As per the requirements in 30 TAC §330.61(g), a land use map has been provided in Appendix 2A – Maps. This map has been prepared using county-provided parcel data from El Paso County, Texas and Doña Ana County, New Mexico to depict land uses within one mile of the Landfill. A detailed written examination of this parcel data can be found in Appendix 2B – Land Use Analysis.

## 2.4.1 Impact on Surrounding Area

As per the requirements set forth in 30 TAC §330.61(h), an evaluation of the impact on the surrounding area was completed for the Landfill. A detailed land-use analysis is included as Appendix 2B – Land Use Analysis. This analysis includes information on zoning for the area within two miles of the property, the character of the surrounding land within one mile of the property, growth trends within five miles of the property, and the proximity of residences and other places of interest within one mile of the facility.

## 2.4.2 Wells Within 500 Feet of Landfill

Consistent with 30 TAC §330.61(c)(2), Drawing P2-23 - Land Use Map of Appendix 2B includes all known water wells within 500 feet of the Landfill. The location, identification and use of each of the water wells is summarized below in Table 2.4-1. As can be seen in this table, four wells are located within the specified radius, none of which are used for domestic supply.

Table 2.4-1
Known Water Wells within 500 Feet of Landfill

| Well Number[1] | Well Use | Latitude | Longitude |
|---|---|---|---|
| 4905309 | Unused | 32.00083 | -106.410 |
| 4905314 | Industrial Use | 31.99028 | -106.408 |
| 4905315 | Industrial Use | 31.99055 | -106.408 |
| 4905325 | Not Classified | 31.99972 | -106.409 |

1. Well number is designated by the Texas Water Development Board state numbering system.

To comply with the regulations in 30 TAC §330.61(h)(5), a search of the Texas Railroad Commission (TRRC) oil and gas well database was conducted in February 2011. This search did not identify any oil and gas wells within the property boundary or within 500 feet of the Landfill.

## 2.5.1 Overview

Consistent with the requirements set forth in 30 TAC §330.61(i), a Traffic Impact Analysis (TIA) was conducted by the City's Department of Transportation for the area immediately surrounding the Landfill. This TIA is included as Appendix 2C – Transportation Study and provides data on:

- The availability and adequacy of access roads for the site;
- Volume of vehicular traffic on access roads within one mile of the facility, both existing and expected, during the life of the facility; and
- The expected traffic volume to be generated by the facility on the access roads within one mile of the facility.

Documentation of coordination between the City and Edgar E. Fino from the Texas Department of Transportation (TxDOT) concerning the future roadway improvements and traffic and location restrictions is provided in Appendix 2C – Transportation Report.

## 2.5.2 Airport Safety

Pursuant to 30 TAC §330.61(i)(5), an evaluation of the facility was completed in accordance with 30 TAC §330.545(a). The identified airports within the general vicinity of the Landfill are provided in Appendix 2A – Maps. The Biggs Army Airfield was identified as being located approximately 9 miles from the Landfill and the El Paso International Airport was identified as being located approximately 11 miles from the Landfill. Additionally, correspondence was submitted to the Federal Aviation Administration to ensure that the Landfill is not:

1. Located within 10,000 feet of any airport runway end used by turbojet aircraft;
2. Within 5,000 feet of any airport runway end used by only piston-type aircraft;
3. Within a six mile radius of any small general service airport runway end used by turbojet or piston-type aircraft; or
4. Within a five mile radius of any large general public commercial airport runway end used by turbojet or piston-type aircraft.

Documentation of this correspondence is also provided in Appendix 2C.

Consistent with §330.61(j)(1)-(4), a general discussion of the geology and soils of the site has been prepared. Detailed discussion of the geology of the site can be found in Section 3.5 of this application. This statement was prepared based on documents submitted for the McCombs Landfill in previous permit modifications with referenced documents provided in the appendices of this major permit amendment.

## 2.6.1 Topography

The original topography of the site was likely hilly. Subsequent quarrying and landfilling operations have significantly modified the natural conditions of the site. The present topography is dominated by large depressions; remnants of the quarrying operations that may range up to 30 feet deep. The landfill areas are currently built-up to elevations over 40 feet above land surface.

## 2.6.2 General Geology[1]

The McCombs Landfill is located within the Rio Grande Rift portion of the Mexican Highlands section of the Basin and Range Physiographic Province (Fnneman, 1931 and Thornbury, 1965). The Mexican Highlands Section is an area of variable geologic structure characterized by high desert valleys and mountain ranges and is subdivided into the Bolson and Rio Grande subsections (Hawley, 1975). The Bolson Subsections cover a large area of southwestern New Mexico, portions of Texas, Chihuahua, Mexico and Arizona. This region is characterized by broad intermontane basins with internal drainage, called bolsons, that are bounded by fault-block mountain ranges.

The mountain ranges on the eastern side of the Bolson subsection trend in a general north-to-northwest direction and typically flank sizeable basins, including the Hueco Bolson in which the site is located (Thornbury, 1965). The Rio Grande Valley in incised into thick deposits of basin fill at the southern end of the Hueco Bolson typically ranging in age from Pliocene to Holocene. A broad alluvial plain with gently sloping terraces characterize the valley of the Rio Grande River.

Tectonic basin formation began in the region in the early Miocene. With basin development, erosion and subsequent deposition of the Santa Fe Group sediments occurred (Gile, et al, 1981; Strain, 1966). Renewed faulting in Late Miocene and Pliocene time, coupled with uplift, produced a series of en echelon grabens, such as the Mesilla and Hueco Bolson that characterize this section of the Rio Grande Rift Valley. These bolsons received several thousands of feet of sediment during the Late Cenozoic (Strain, 1966). The ancestral Rio Grande River flowed into the closed

[1] Site Characterization and Monitoring Plan, McCombs Municipal Landfill, El Paso, Texas, SHB-AGRA, October 1993 (Appendix 3K, Attachment 1)

basins in the area during the Pliestocene depositing thick sequences of sediment and forming an ephemeral lake (Strain, 1969).

The Hueco Bolson deposits were divided into two rock stratigraphic units, the Fort Hancock Formation and the Camp Rice Formation (Strain, 1969). The older Fort Hancock Formation is a massive unit composed of poorly consolidated clays, silt and fine-grained sands. In the early Pleistocene time, adjacent basins aggraded to levels sufficient to coalesce with the Hueco Bolson. Periods of high precipitation resulted in the formation of a large ephemeral lake system, Lake Cabeza de Vaca (Strain, 1966). Deposits of fine-grained sediments in the Hueco Bolson continued until an outlet to the southeast formed in the early Pliestocene. This outlet breached Lake Cabeza de Vaca and changed the depositional environment from predominantly lacustrine to fluvial (Strain, 1980).

The Camp Rice Formation unconformably overlies the Fort Hancock Formation and is primarily composed of gravel, sand, silt and occasional discontinuous lenses of volcanic ash. The Camp Rice Formation is composed of two basic subdivisions, a fluvial and a piedmont facies (Gile, et al, 1981). The fluvial facies is chiefly sand to pebbly river-channel deposits with subordinate fine-grained overbank units. This facies thickens toward the bolson axes and commonly wedges out against the piedmont facies. The permitted landfill area is probably underlain by fluvial deposits of the Camp Rice Formation.

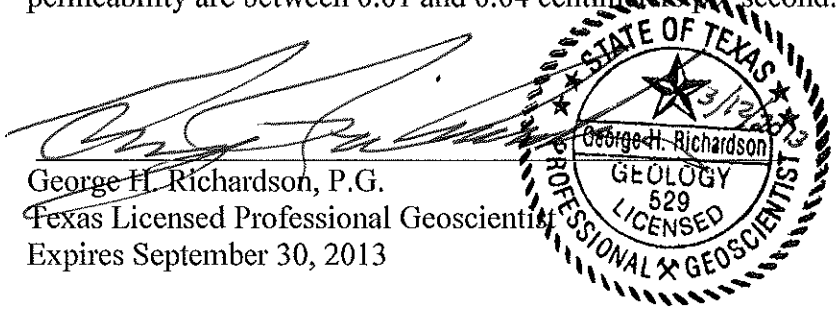
## 2.6.3 General Soils

The McCombs Landfill is located on deposits of the Hueco Bolson, probably Camp Rice Formation. These deposits primarily consist of clay, sand, and gravel, with some caliche. The landfill site is underlain by Tertiary and Quaternary basin (bolson) deposits, overlain by areas of gravel and caliche rimrock. Recent Quaternary alluvial deposits are also present in the landfill vicinity in topographically low areas.

Boring logs for wells drilled on site to depths greater than 500 feet generally indicate deposits of:

- 0 – 50 feet Sand, and sand and gravel;
- 50-250 feet Sand, with some clay;
- 250-470 feet Sand and fine gravel mix; and
- 470-560 feet Sandy clay.

In general, the relatively clean sands are non-plastic, while sandy clay ranges from low to high plasticity. Permeability tests were not considered necessary based on the soil types encountered during the site characterization. Estimated coefficients of permeability are between 0.01 and 0.04 centimeters per second.



George H. Richardson, P.G.
Texas Licensed Professional Geoscientist
Expires September 30, 2013

## 2.6.4 Fault Areas[2]

The fault area restriction states that no new landfill units or lateral expansions can be placed within 200 feet of a fault that has experienced Holocene displacement. This restriction provides for minimal setbacks from actual fault traces since faults can result in damage to the landfill's integrity through:

- Movement along the fault causing displacement;
- Seismic activity associated with faulting resulting in seismic shaking of facility structures; and
- Seismic shaking resulting in slope failures.

The original permit states that "...an Eastern Boundary Fault Zone exists between the Franklin Mountains and the Hueco Bolson deposits" and "...assuming continuous movement this (movement of the fault) would equate to approximately 0.005 inches per year" (DRA, 1984).

Since several Quaternary faults have been identified within and at the margins of the Hueco Bolson, SHB reviewed recent published geologic mapping and literature to evaluate the proximity and age of known faults in the vicinity of the McCombs Landfill.

Numerous fault scarps of Quaternary age are preset in the Hueco Bolson near the Landfill. One inferred scarp apparently traverses the northeastern quadrant of the Landfill permit area (SHB, 1993). This fault was not identified on the geologic map prepared by Harbour (1972). Insufficient information is available to confirm or refute the presence of the fault. This fault is more than 200 feet from any existing or proposed Landfill units. Other north-south trending scarps are also apparent in the area.

The age of faulting in Hueco Bolson has been dated as less than 0.5 million years (m.y.), based on offset in the Camp Rice Formation and in soils formed on the Camp Rice formation (Seager 1980). A report by Collins and Raney (1991), indicates that those faults near the site displace deposits of middle Pliestocene age (approximately 200,000 to 900,000 years old). Evidence of displacement of younger deposits have not been documented either because younger sediments do not exist along the fault traces or have been covered by windblown sand. Collins and Raney (1991) point out that movement on the basin bounding the East Franklin Mountains located a few miles to the west of the landfill may be as young as Holocene. Other basin bounding faults and some of the intragraben faults (such as those near the Landfill) most recently experienced rupture during the middle to late Pliestocene. More precise dating of the faults has not been performed, however, it is apparent that the faults have recurrence intervals of more than 10,000 years; otherwise the fault traces would be more clearly defined.

[2] Evaluation of Location Restrictions, McCombs Landfill, El Paso, Texas, SHB-AGRA June 1994 (Appendix 3K, Attachment 4)

## 2.6.5 Seismic Impact Zones[2]

The seismic impact zone restrictions (30 TAC §330.557) states that "New municipal solid waste landfill (MSWLF) units and lateral expansions shall not located in seismic impact zones, unless the owner or operator demonstrates to the Director that all containment structures, including liners, leachate collection systems, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth materials for the site."

Under this regulation, a seismic risk zone is considered to be an area that has a 10 percent or more probability that the maximum horizontal acceleration in lithified material, expressed as a percentage of the earth's gravitational pull (g), will not exceed 0.10g in 250 years.

This regulation pertains to new MSWLF units and lateral expansions. This permit modification is a vertical expansion of the existing permitted Landfill and no new horizontal area will be opened under this permit modification. Based on the work completed by SHB-AGRA (1994) a review of USGS Miscellaneous Field Study Map MF-2121, "Probabilistic Earthquake Acceleration and Velocity Maps for the United States and Puerto Rico", (Algermissen, et. al, 1991) was conducted. El Paso County (and the Landfill) fall outside of any designated seismic impact zone.

The map on Figure 2-1 is from the USGS website:

http://earthquake.usgs.gov/hazards/apps/map/

Based on 2008 revised data, this map demonstrates the facility is located within a seismic impact zone and exceeds the 30 TAC §330.557 standard of 10 percent or more probability. The seismic impact zone restrictions only apply to new MSWLF units and lateral expansions. The permit modification for the Landfill is for a vertical expansion and no previously-undisturbed earth will be added to the Landfill boundary.

The acreage within the proposed facility boundary was increased for this permit amendment from 327.29 to 346.74 acres at the request of the TCEQ to reflect the existing Landfill buildings and retention ponds that were submitted and approved by the TCEQ under Permit Amendment 729A. These features included existing buildings associated with the landfill operations on property previously leased and now owned by the City of El Paso. Retention ponds within this area were designed by Moreno Cardenas, Inc. to handle runoff from existing buildings and infrastructure (Permit Amendment 729-A, December 2010) in accordance with the applicable codes in place at that time.

## 2.6.6 Unstable Areas

Consistent with 330.61(j)(4) and 330.559, unstable areas documentation was prepared and part of the application to demonstrate that the Landfill meets the location restriction for unstable area.

TCEQ regulations require the owner or operators of new MSWLF units, existing MSWLF units and lateral expansions located in an unstable area shall demonstrate that engineering measures have been incorporated into the MSWLF unit's design to

ensure that the integrity of the structural components of the MSWLF unit will not be disrupted.

An unstable area is defined by TCEQ as a location that is susceptible to natural or human-induced events or forces capable of impairing the integrity of some or all of the landfill's structural components responsible for preventing releases from a landfill. An unstable area can exhibit poor foundation conditions, area susceptible to mass movement, and karst terrains.

### 2.6.6.1 Unstable Slopes

No landslide deposits in the vicinity of the Landfill are shown on any published geologic information and none have been identified during site visits (SHB-AGRA, 1994).

### 2.6.6.2 Karst

Several thousand feet of basin filling sediments occur beneath the Landfill. No limestone or other soluble units subject to karst formation exists in the vicinity (SHB-AGRA, 1994).

### 2.6.6.3 Subsidence

Subsidence has been documented in the El Paso metropolitan area as a result of groundwater withdrawal and subsequent decline in groundwater levels, especially in area having thick accumulations of clay in the subsurface. The Landfill is located in an area of documented groundwater withdrawal resulting in groundwater declines up to 40 feet (Ashworth 1990). No land surface subsidence has been documented in the vicinity of the Landfill (Land and Armstrong, 1985). Due to depth to groundwater, formation of large scale subsidence features is not anticipated, but cannot be precluded (SHB-AGRA, 1994)

### 2.6.6.4 Liquefaction

Since groundwater occurs at depths of 300-400 feet below land surface, no liquefaction concerns exist (SHB-AGRA, 1994).

McCombs Landfill, El Paso, Texas

SAIC

## 2.7.1 Groundwater Conditions

Consistent with §330.61(k)(1), a discussion of groundwater conditions at and near the facility was prepared. Data pertaining to the hydrogeology of the area and groundwater beneath the Landfill are provided in the reports *Site Characterization and Monitoring Plan, McCombs Municipal Landfill, El Paso, Texas* included in Appendix 3K, Attachment 1 and *Groundwater Monitoring System Installation, City of El Paso McCombs Landfill* included in Appendix 3L, Attachment 1.

The regional groundwater system in the area primarily consists of the Hueco Bolson aquifers. The Hueco Bolson is divided into the City Artesian area, the Mesa area and the Lower Valley (Leggart, 1962). The Mesa area extends north of the City Artesian area into New Mexico and east to the Hueco Mountains. The Landfill is located within the Mesa area.

Two aquifers occur in these areas: an upper aquifer in the Rio Grande alluvium and a lower aquifer in the Hueco Bolson deposits. Since no known impermeable zone of regional extent separates these aquifers, the Rio Grande alluvium and the Hueco Bolson are considered to be, at least in part, hydrologically connected in the City Artesian and Lower Valley areas (Alvared and Buckner, 1980). The Mesa area primarily consists of Hueco Bolson deposits. Historic withdrawals of groundwater since 1906 for public water supply and irrigation have caused major declines in the water levels. The average water level decline in the Hueco Bolson from 1903 to 1980 is approximately 53 feet (White, 1987).

Locally, recharge to the aquifer occurs due to mountain front infiltration of precipitation from the surface and from the injection of treated sewage into the aquifer from the Hueco Bolson Recharge Project (White and Sladek, 1990). Numerous injection wells were constructed northeast of El Paso and water from the Fred Hervey Water Treatment Plant has been injected into the aquifer by El Paso Water Utilities (EPWU) since the mid-1980s. Since 1991, EPWU has been selling water to El Paso Electric Company for use as cooling water at the Newman Plant, thus less water has been injected into the aquifer (Sperka, 1993).

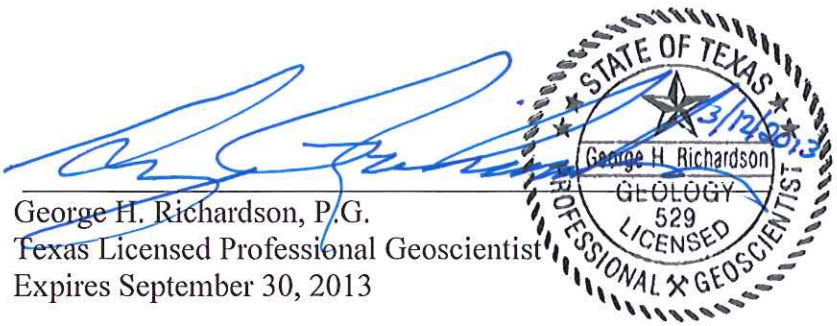
Based on available information, regional groundwater flow direction in the McCombs Landfill area is to the south-southeast. Groundwater movement in the area is generally less than 1.0 feet per day (White, 1987). EPWU groundwater data indicate that the static groundwater elevation in the area is between 3,670 and 3,675 feet MSL or approximately 370 to 390 feet below ground surface (EPWU, 1993).

Groundwater conditions at the site were determined using data from three groundwater monitoring wells constructed in 2003 around the landfill as part of the approved Subtitle D groundwater monitoring system. Water levels data from December 6, 2010

indicates ground water beneath the site occur approximately 390 to 398 feet below land surface, with corresponding elevations of 3,677 to 3,686 feet AMSI. Based on groundwater level measurements at the site, groundwater flow direction is S70° East or to the east-southeast.

Parkhill, Smith & Copper (PSC) completing an additional hydrogeologic evaluation for the Landfill that included the installation of two additional monitoring wells PZ-4 and PZ-5. Data collected from August 2011 through July 2012 indicate groundwater flow direction is predominately to the east/southeast, likely influenced by the drawdown from the Cemex well located near the southeast corner of the landfill and just north of Stan Roberts Road. The PSC report also notes a northwest component of groundwater flow in the southwest portion of the site.

The site-specific groundwater flow direction correlates with regional groundwater flow direction within the Hueco Bolson aquifer.



George H. Richardson, P.G.
Texas Licensed Professional Geoscientist
Expires September 30, 2013

## 2.7.2 Surface Water Conditions

Surface water conditions for the development of the site was designed to be consistent with 30 TAC 330.61(k). The surface water drainage report and design is included in Section 3.3 – Facility Surface Water Drainage Report.

The Landfill is located in the city limits of El Paso and encompasses a total of 347 acres. The surrounding areas are generally unpopulated and are predominantly undeveloped, agricultural or industrial.

Currently, stormwater on site is directed away from active portions of the landfill by ditches designed for the 25-year storm event. The ditches direct water to the three onsite stormwater retention ponds. These ponds are designed to hold the 100-year storm event as well as contingency storage for sediment. Stormwater runoff is collected in a v-ditch around the perimeter of the landfill units and is directed into an existing stormwater pond on the southeastern corner. Runoff from north of the existing landfill is currently captured within the mined pit area. Some of the runoff in the northwest corner continues to the site of existing Retention Pond A. Runoff generated to the east is captured in the mined pit area. Runoff generated in the existing landfill areas is conveyed into existing Retention Pond D, west of the existing fee house, and existing Retention Pond E, in the southeastern corner of the developed landfill area. These exiting stormwater patterns are shown on Drawing P3-4, Existing Drainage Conditions, in Appendix 3C.

Four ponds will exist in the final cover condition. The final contours include four ponds to break up drainage areas (the existing Retention Ponds A and E, and Ponds B and C), and in effect reduce sheet flow and minimize erosion. Existing Pond D is no longer needed as that area is filled to grade and flow is conveyed in a v-ditch to Pond E. Perimeter ditches will be constructed as the landfill final contours are approached. These ditches will direct water to the retention ponds where they will retain the 100-year event and sediment. The landfill will provide care and management, both during construction and long term, of soil erosion and control of sediment due to surface water.

The care and management of soil erosion and sedimentation is outlined in Part III – Erosion and Sedimentation Control Plan. The facility will prevent discharge of pollutants to waters of the state. There are no waters of the United States or Corps of Engineers' jurisdictional waters of the state on site, therefore, no Section 404 permit is required. The Landfill submitted a notice of intent (NOI) to comply with the Texas Pollutant Discharge Elimination System (TPDES) Stormwater Permit relating to stormwater discharge and received Permit No. TX05L795 from the TCEQ on October 28, 2011. A copy of this permit is included in Appendix 2D – TPDES Multi-Sector General Permit.

## 2.8.1 Abandoned Water Wells

No known abandoned water wells exist within the permit boundary of the Landfill. Existing water wells are identified on the Land Use Map located in Appendix 2A – Maps and a description of each well is noted in Section 2.4.2.

If an abandoned water well is indentified, the City shall provide the executive director with a written certification that all such wells have been capped, plugged, and closed in accordance with all applicable rules and regulations of the commission or other state agency. This certification will be provided to the TCEQ within 30 days after the well has been properly plugged. If necessary, a permit modification will be submitted to the executive director if the identification of an abandoned water well affects the liner installation plan.

## 2.8.2 Abandoned Oil Wells

No abandoned crude oil or natural gas wells, or other wells associated with the mineral recover that are under the jurisdiction of the TRRC were found within the permit boundary at the Landfill. As noted in Section 2.4.2, a search of the TRRC oil and gas well database conducted in February of 2011 did not identify any existing oil or gas wells within the Landfill boundary or within 500 feet of the Landfill.

If an abandoned oil well is identified, the City shall provide the executive director with a written certification that all such wells have been properly capped, plugged, and closed in accordance with all applicable rules and regulations of the TRRC. This certification will be provided to the TCEQ within 30 days after the well has been properly plugged.

# Section 2.9
# FLOODPLAINS AND WETLANDS STATEMENT
30 TAC §330.61(m)

A floodplain restrictions and wetlands restrictions report was completed in June of 1994 by SHB AGRA Earth and Environmental (SHB) and is provided for reference in Appendix 3K, Attachment 4. Information from that report has been included in this statement to meet the requirements of 30 TAC §330.61(m).

## 2.9.1 Floodplains

According to 40 CFR §258.11**,** 30 TAC §330.307 and §330.547, "owners or operators of new MSWLF units, existing MSWLF units, and lateral expansions located in 100-year floodplains must demonstrate that the unit will not restrict the flow of the 100-year flood, reduce the temporary water storage capacity of the floodplain, or results in washout of solid waste so as to pose a hazard to human health and the environment."

As shown in the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) provided in Appendix 2E – Floodplains and Wetlands Documentation, a portion of the landfill is located within the 100-year floodplain. No waste disposal activities will occur in the section of the property lying within the 100-year floodplain. Instead, existing Retention Pond A has been designed to cover the area affected by the 100-year floodplain. Refer to Section 3.3 – Facility Surface Water Drainage Report for further details concerning the effects of the 100-year floodplain and the design of the stormwater detention ponds.

## 2.9.2 Wetlands

According to 30 TAC §330.553, new MSW landfill units, lateral expansions, and material recovery operations from a landfill shall not be located in wetlands, unless the owner or operator makes specific demonstrations to show that the landfill will not cause environmental harm.

Based on a 1982 map prepared by T.E. Dohl, the Landfill is not located in area designated as a wetland. This map is included in Appendix 2E – Floodplains and Wetlands Documentation.

# Section 2.10
# ENDANGERED SPECIES STATEMENT
30 TAC §330.61(n)

To meet the requirements of 30 TAC §330.61(n) and 30 TAC §330.551, a letter dated August 13, 1982 from the United States Fish and Wildlife Service (USFWS) has been included in Appendix 2F – Endangered Species Documentation. This letter was previously included in both the 1984 and 2002 permit amendment application submittals. Additionally, current correspondence between the Texas Parks and Wildlife Department (TPWD) and the U.S. Fish and Wildlife Service is also provided in Appendix 2F.

According to the 1982 USFWS letter, the American Peregrine Falcon may use the project site as a feeding area or pass through the area during migration. According to the information provided on the USFWS website, the American Peregrine Falcon was delisted from the federal endangered species list on August 25, 1999. However, the American Peregrine Falcon remains a State of Texas protected species. A copy of the USFWS species profile is also provided in Appendix 2F – Endangered Species Documentation.

As indicated in the USFWS letter, it is unlikely that the Landfill will have any effect on this species. However, if the American Peregrine Falcon were to be observed within the permitted landfill area, the employees will be instructed to follow the steps listed below:

1. Avoid contact with the bird;
2. Temporarily halt or move site operations to an area away from the bird's location to prevent disrupting the bird's activities while feeding or passing by the site;
3. Wait until the bird abandons the site on its own will; and
4. Resume normal site operations once the bird has taken flight.

In addition, Landfill personnel will be trained regarding the bird's physical characteristics and appearance in order to be able to identify it at once and with certainty during operations. This training will prevent unnecessary and unwarranted disruptions of site activities due to the presence of birds that may look similar to the American Peregrine Falcon.

According to the 2012 TPWD response letter, the following species have been listed as threatened or endangered under the Endangered Species Act (ESA) and have the potential to occur in El Paso County:

- Least Tern – Listed 08/28/1985
- Northern Aplomado Falcon – Listed 02/25/1986
- Mexican Spotted Owl – Listed 03/16/1993
- Southwestern Willow Flycatcher – Listed 02/27/1995

The following are state-listed threatened species that could potentially occur in the area:

- Texas Horned Lizard
- Mountain Short-Horned Lizard

The following are state-listed species of concern that could potentially occur in the area:

- Western Burrowing Owl
- Desert Night-Blooming Cereus

Further information regarding these species, their suitable habitats, and avoidance procedures are included in Appendix 2F.

# Section 2.11
# TEXAS HISTORICAL COMMISSION REVIEW
30 TAC §330.61(o)

As required by 30 TAC §330.61(o), a letter was submitted to the Texas Historical Commission to document compliance with the Natural Resources Code, Chapter 191, Texas Antiquities Code. This letter and the Texas Historical Commission response can be found in Appendix 2G – Texas Historical Commission Documentation.

## Land Use Map

### Water Wells (From TWDB Database)

- Industrial Use
- Unused
- Not Classified

### Existing Land Use

- City of El Paso
- Residential
- Mixed Use
- Commercial
- Industrial
- Public/Institutional
- Undeveloped
- Military
- ROW/Utility
- Parks and Open Space
- No Classified Activity
- 500 Foot Radius Around Landfill
- 0.25 mile radius Around Landfill
- 1 Mile Around Landfill
- Landfill Boundary
- County Boundary
- State Boundary

## NOTES

1. LAND USE MAP CREATED USING PARCEL DATA PROVIDED BY EL PASO COUNTY, TEXAS AND DOÑA ANA COUNTY, NEW MEXICO.
2. MAP CREATED USING ARCGIS SOFTWARE VERSION 9.2.
3. REFER TO APPENDIX 2B–LAND USE ANALYSIS FOR DETAILED INFORMATION ON THE LAND USE IN THE AREA.
4. NO ARCHAEOLOGICALLY SIGNIFICANT OR HISTORICAL SITES, LOCATIONS OF EXCEPTIONAL AESTHETIC QUALITY, SCHOOLS, LICENSED DAY–CARE FACILITIES, CHURCHES, CEMETERIES, HOSPITALS, LAKES OR STREAMS WERE IDENTIFIED WITHIN ONE MILE OF THE FACILITY BOUNDARY. ONE POND LOCATED APPROXIMATELY 1,800 FEET EAST OF THE FACILITY WAS IDENTIFIED. THE POND IS PART OF THE CEMEX QUARRY AREA FOR STORMWATER CONTROL AND IS DRY MOST OF THE YEAR.
5. REFER TO SECTION 2.4 FOR INFORMATION ON OIL, GAS AND WATER WELLS.

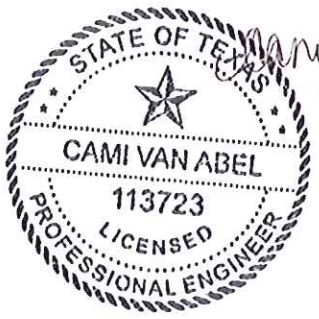
## List of Tables

Table 2B-1 Land Use Within One Mile of McCombs Landfill ..... 2B-2
Table 2B-2 Growth Trends Within Five Miles of McCombs Landfill ..... 2B-3



## 2B.1 Introduction

The following land use analysis was prepared to evaluate the area surrounding the Landfill property. This study examines the zoning within two miles of the property, the character of the surrounding land within one mile of the property, growth trends within five miles of the property, and the proximity of residences, commercial establishments and other places of interest within one mile of the property. The results are summarized in the following sections.

## 2B.2 Zoning

The Landfill is located within the City limits approximately 10 miles northwest of downtown, and lies within 500 feet of the Texas-New Mexico border as shown in Drawing P2-24 – Zoning Map. The City and the adjacent Doña Ana County, New Mexico provide zoning ordinances that control the land use within the area.

In Texas, the land surrounding the Landfill is predominately zoned for light or heavy industrial use or as a ranch or farm district. In New Mexico, the surrounding land is zoned as a Performance District (PD) in Doña Ana County. According to the Doña Ana County Land Use Regulations and Zoning Ordinance, the purpose of zoning a region as a PD is to allow flexibility for land use activities in the rural areas of the County by acting as a mixed use zone.

## 2B.3 Character of Surrounding Land

The land surrounding the Landfill is predominately owned by the City within the State of Texas, and is undeveloped or for rural residential use within the State of New Mexico, as shown in Drawing P2-21 through Drawing P2-23. The following Table 2.4B-1 provides a detailed breakdown of the land use within a one-mile radius of the Landfill.

Table 2.4B-1
Land Use Within One Mile of McCombs Landfill

| Land Use | Area (Acres) | Area (Percent of Total) |
|---|---|---|
| City of El Paso | 2,133.01 | 51.57% |
| Undeveloped | 973.10 | 23.53% |
| Industrial | 617.02 | 14.92% |
| Residential | 233.78 | 5.65% |
| No Classified Activity | 100.03 | 2.42% |
| Right-of-Way/Utility | 58.89 | 1.42% |
| Mixed Use | 14.55 | 0.35% |
| Commercial | 5.86 | 0.14% |
| Total | 4,136.24 | 100.00% |

As shown in Table 2.4B-1, 51.57 percent of the land within a one-mile radius of the Landfill is owned by the City of El Paso and 23.53 percent of land is undeveloped. Residential housing accounts for approximately 5.65 percent of the land within a one-mile radius of the Landfill.

No schools, licensed day-care facilities, churches, hospitals, cemeteries, or lakes were identified through visual survey or parcel records within one mile of the Landfill. One man-made pond was identified approximately 1,800-feet east of the facility. The pond is part of the CEMEX quarry area for stormwater control and is dry most of the year. It should also be noted that due to ongoing quarry operations, the size, number, and location of man-made ponds may vary at different times during mining operations.

## 2B.4 Growth Trends

Visual comparison of the two sets of Census tracts revealed that three of the 2000 Census have been divided for the 2010 Census. To make a valid comparison between each 2000 tract and the corresponding area of the 2010 tracts, Table 2.4B-2 was created. Table 2.4B-2 shows the tracts and population from the 2000 and 2010 Censuses. Some 2000 Census tracts in the five mile radius surrounding the Landfill were divided for the 2010 Census. In these cases, population totals for the 2010 tracts were summed to reflect an area equivalent to the 2000 Census tract.

Table 2.4B-2
Growth Trends Within Five Miles of McCombs Landfill

| 2000 Census | | 2010 Census | | Total 2010 Population | Percent Change |
|---|---|---|---|---|---|
| Tract | Population | Tract | Population | | |
| 1.06 | 5,266 | 1.06 | 6,081 | 6,081 | 15.47 |
| 1.07 | 6,033 | 1.07 | 5,087 | 5,087 | -3.75 |
| 1.08 | 2,844 | 1.08 | 2,505 | 2,505 | -13.14 |
| 2.03 | 7,122 | 2.07 | 4,761 | 8,190 | 14.99 |
| | | 2.08 | 3,429 | | |
| 9.00 | 8,705 | 9.01 | 3,167 | 13,108 | 50.58 |
| | | 9.02 | 9,941 | | |
| 18.02 | 5,807 | 18.02 | 6,354 | 6,354 | 9.42 |
| 18.04 | 6,117 | 18.04 | 6,965 | 6,965 | 13.86 |
| 101.01 | 1,384 | 101.01 | 3,673 | 3,673 | 165.39 |
| 102.06 | 7,795 | 102.1 | 5,902 | 14,445 | 85.31 |
| | | 102.11 | 2,930 | | |
| | | 102.12 | 5,613 | | |
| 102.07 | 2,266 | 102.07 | 4,803 | 4,803 | 111.96 |

As can be seen from Table 2.4B-2, several tracts had significant growth from 2000 to 2010. These high-growth tracts are located southeast of the landfill and are mostly owned by the City of El Paso or zoned for mixed use as shown on the Land Use Map included as Drawing P2-23. The high growth for these tracts can be attributed to the construction of two neighborhoods approximately 2.5 to 3 miles away, respectively.

According to the United States Census Bureau, El Paso County experienced a growth rate of approximately 10.5 percent between 2000 and 2009[1] and Dona Ana County experienced a growth rate of approximately 18.2 percent between 2000 and 2009. A majority of the population growth rates summarized in Table 2.4B-2 follow these trends.

## 2B.5 Proximity to Residences, Commercial Establishments and Other Uses

Based on the visual survey conducted on November 10th, 2010, and from parcel data received from Doña Ana County, New Mexico, there are approximately 185 single family residences and mobile homes within a one-mile radius of the Landfill. The residence closest to filling activities is estimated to be 1,500 feet from the property boundary, and 1,550 feet from the waste limit.

SAIC identified 8 parcels of mixed use/commercial establishments within one mile of the facility (refer to Drawing P2-3 in Appendix 2B). The area immediately to the east of the Landfill is a quarry operated by Cemex, to the south approximately one mile is El Paso Natural Gas Company (private), and immediately to the west is an

[1] Most recent data available from the United States Census Bureau is for 2009.

undeveloped area owned by El Paso Electric (private). To the northeast of the Landfill, within New Mexico (0.25 to 1-mile away), are 5 identified small businesses within the residential neighborhood.

SAIC did not identify any schools, licensed day care centers, churches, hospitals, cemeteries, lakes, streams, archaeologically significant sites, historic sites, or locations of exceptional aesthetic quality within one-mile of the Landfill based on the visual survey and parcel records. One man-made pond was identified approximately 1,800-feet east of the facility. The pond is part of the CEMEX quarry area for stormwater control and is dry most of the year. It should also be noted that due to ongoing quarry operations, the size, number, and location of man-made ponds may vary at different times during mining operations.

## 2B.6 Conclusions

As can be seen from Table 2.4B-1, approximately 90 percent of the land surrounding the Landfill is either owned by the City, undeveloped or used for industrial purposes. Less than 6 percent of the land within one mile is used for residential use.

Most of the area surrounding the landfill experienced growth similar to the El Paso County and Dona Ana County growth rates. Some areas experienced higher population growth rates due to the construction of neighborhoods within 3 miles of the Landfill. However, it is unlikely that these same growth rates will continue in the future.

Mr. Fredric J. Doran, P.E.
Senior Environmental Engineer
SAIC Energy, Environment, and Infrastructure
1380 Corporate Center Curve, Suite 305
St. Paul, MN 55121

Dear Mr. Doran:

This is in response to your letter of January 11, 2012, about the proposed expansion of the McCombs Municipal Solid Waste Landfill in El Paso, Texas. Based on the information provided, we found no public-use airports within five miles of the site. We have no objection to the proposal from the standpoint of potential wildlife hazards to aircraft.

We have assigned this proposed landfill site File No. 2012-002TX. Please use this number in any future correspondence about this facility. Thank you for coordinating this project with the Federal Aviation Administration.

If you have any questions, please call me at (817) 222-5656.

Sincerely,

Faye Nedderman
Executive Technical Assistant

Faye Nedderman
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, Texas 76137

Subject: **Facility Compliance with Airport Safety**
**McCombs Municipal Solid Waste Landfill, El Paso, Texas**

Dear Ms. Nedderman:

The McCombs Municipal Solid Waste Landfill (Landfill) located in El Paso, Texas (City) is proposing a vertical expansion of the existing Landfill footprint to provide additional capacity. The Landfill is located in El Paso County within the El Paso city limits and serves the waste needs of the City and the surrounding area. The Landfill is an existing Type 1 MSW disposal facility owned and operated by the City. The Landfill is located at the northeast corner of the intersection of McCombs Road and Stan Roberts Road (FM 2529) in El Paso, Texas. The address of the Landfill is 13660 McCombs Road.

The proposed vertical expansion will increase the height of the Landfill from the currently permitted elevation of 4,125 feet mean sea level (MSL) to 4,305 feet MSL. The existing permitted boundary of the Landfill is currently 327 acres (permitted in 1984), and is not proposed to increase. The primary use for this facility will remain dedicated for disposal of municipal solid waste.

Pursuant to Texas Administrative Code Chapter 330 (30 TAC §330.61 (i)(5) and 30 TAC §330.545 (a)), please verify that the facility is not:

1. Located within 10,000 feet of any airport runway end used by turbojet aircraft;
2. Within 5,000 feet of any airport runway end used by only piston-type aircraft;
3. Within a six mile radius of any small general service airport runway end used by turbojet or piston-type aircraft; or
4. Within a five mile radius of any large general public commercial airport runway end used by turbojet or piston-type aircraft.

Subject: **Transportation Impact Analysis**
**McCombs Municipal Solid Waste Landfill, El Paso, Texas**

Dear Mr. Fino:

The City of El Paso is anticipating reopening the McCombs Landfill (located on McCombs and Stan Roberts Road) and has prepared a Traffic Impact Analysis (TIA) that was sent to you previously for review, and is included as Attachment 1 for your reference. The Landfill is located at the northeast corner of the intersection of McCombs Road and Stan Roberts Road (FM 2529) in El Paso, Texas. The address of the Landfill is 13660 McCombs Road.

The purpose of this letter is to document correspondence with the Texas Department of Transportation (TxDOT) pursuant to Texas Administrative Code Chapter 330 (30 TAC §330.61 (i)). Please provide a written response to the TIA provided on any traffic or location restrictions that may exist.

If you have any questions or require additional information, please contact me at 651-994-8415 or fredric.j.doran@saic.com.

Sincerely,

# Traffic Impact Analysis

## McCombs Land Fill Facility

**Department of Transportation**

Jan 12, 2011

STATE OF TEXAS
SERGIO REYES
106645
PROFESSIONAL ENGINEER

4-4-12

## Introduction

This Analysis was prepared for the proposed landfill, located immediately east of McCombs between State Line and Stan Roberts. The purpose of the study is to analyze the traffic and transportation impacts of the proposed development on adjacent road network.

### *Study Area*

Figure 1 shows the project site and the surrounding area. McCombs is a two lane undivided roadway which provides north/south travel within the study area. State Line and Stan Roberts are two lane undivided roadways which provides east/west travel.

Figure 1. Study Area

## Methodology

For this study, the following milestone years were analyzed:

- Existing (2010)
- Future traffic conditions in the build out year (2011)
- Future traffic conditions 10 year after build out (2021)
- Future traffic conditions end of life of the landfill (2040)

### *Data Collection*

The surrounding roadway network adjacent to the land fill site was analyzed to establish baseline traffic flow.

For this traffic impact study, AM, PM, and ADT volumes are needed to evaluate the roadway capacity analyses. Roadway Tube Counts were taken at various segments in the study area. Figure 2 also shows the existing weekday AM\PM, and 24-hour ADT volumes.

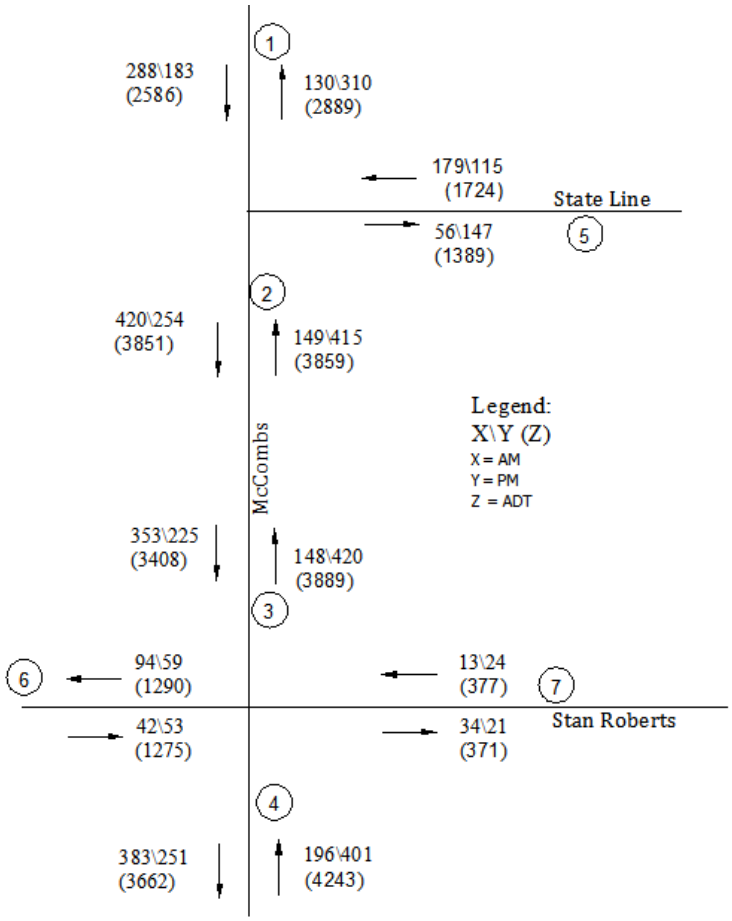

Figure 2: Existing AM\PM and ADT roadway count volumes (2010)

***Background Growth***
In order to obtain future year background traffic, a growth rate was applied to the existing (2010) traffic volumes to account for ambient growth in traffic. The growth rate was derived from the El Paso MPO model.

## Trip Generation and Distribution

***Site generated traffic***
Site generated traffic was determined based on the information provided by The City of El Paso's Environmental Services department. The trip generation for the Site is shown in Table 1.

| | ADT | |
|---|---|---|
| | 2011 | 2040 |
| City Trash | 80 | 96 |
| Commercial Trash | 100 | 120 |
| Employees | 30 | 36 |
| Public | 100 | 120 |

Table 1: Site trip generation

***Trip distribution***
Distribution of site traffic onto the street system was based on the existing traffic patterns. Multiplying the site generated trips by the percentage distribution provides the projected trip assignments to the road network.

## Traffic Operations Analysis

***Analysis Methodology***

The TransBorder 2035 Metropolitan Transportation Plan (MTP) examines projects based on the volume to capacity ratio (V/C) which was then defined in terms of level of mobility (LOM). Table 2 shows the definition of LOM rankings based on V/C.

Table 2- LOM criteria

| **Level of Mobility** | **V/C Ratio** |
|---|---|
| Tolerable | <0.85 |
| Moderate | >=0.85 <1.0 |
| Serious | >=1.0<1.25 |
| Severe | >=1.25 |

### *2010 Existing Traffic Conditions*

The existing traffic conditions are shown below. All roadway segments operate at a "Tolerable" LOM.

| 2010 Existing | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 5475 | 0.46 | Tolerable | 418 | 0.35 | Tolerable | 493 | 0.41 | Tolerable |
| 2 | 7710 | 0.64 | Tolerable | 569 | 0.47 | Tolerable | 669 | 0.56 | Tolerable |
| 3 | 7297 | 0.61 | Tolerable | 501 | 0.42 | Tolerable | 645 | 0.54 | Tolerable |
| 4 | 7905 | 0.66 | Tolerable | 579 | 0.48 | Tolerable | 652 | 0.54 | Tolerable |
| 5 | 3113 | 0.26 | Tolerable | 235 | 0.20 | Tolerable | 262 | 0.22 | Tolerable |
| 6 | 2565 | 0.21 | Tolerable | 136 | 0.11 | Tolerable | 112 | 0.09 | Tolerable |
| 7 | 748 | 0.06 | Tolerable | 47 | 0.04 | Tolerable | 45 | 0.04 | Tolerable |

### *2011 Full Site Build-Out No Build*

It is anticipated that the landfill will be at full build-out in 2011. One year of growth in background traffic results in minor increases in V/C ratio.

| 2011 Background No build | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |

### *2011 Full Site Build-Out Plus Site Traffic Conditions*

With the addition of the opening day site-generated traffic to the 2011 background traffic, V/C ratio at the roadway segments tend to increase slightly as show below.

| 2011 Background + Site | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 5627 | 0.47 | Tolerable | 433 | 0.36 | Tolerable | 509 | 0.42 | Tolerable |
| 2 | 7884 | 0.66 | Tolerable | 579 | 0.48 | Tolerable | 681 | 0.57 | Tolerable |
| 3 | 7752 | 0.65 | Tolerable | 510 | 0.42 | Tolerable | 657 | 0.55 | Tolerable |
| 4 | 8416 | 0.70 | Tolerable | 628 | 0.52 | Tolerable | 702 | 0.59 | Tolerable |
| 5 | 3269 | 0.27 | Tolerable | 248 | 0.21 | Tolerable | 276 | 0.23 | Tolerable |
| 6 | 2634 | 0.22 | Tolerable | 140 | 0.12 | Tolerable | 115 | 0.10 | Tolerable |
| 7 | 810 | 0.07 | Tolerable | 51 | 0.04 | Tolerable | 49 | 0.04 | Tolerable |

### *2021 Background Traffic Conditions No Build*

An additional ten years of growth in the background traffic results in significant increases in the V/C ratio when compared to 2011, as shown below.

| 2021 Background No build | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 5975 | 0.50 | Tolerable | 456 | 0.38 | Tolerable | 538 | 0.45 | Tolerable |
| 2 | 9378 | 0.78 | Tolerable | 692 | 0.58 | Tolerable | 814 | 0.68 | Tolerable |
| 3 | 8872 | 0.74 | Tolerable | 609 | 0.51 | Tolerable | 784 | 0.65 | Tolerable |
| 4 | 8871 | 0.74 | Tolerable | 650 | 0.54 | Tolerable | 732 | 0.61 | Tolerable |
| 5 | 4644 | 0.39 | Tolerable | 351 | 0.29 | Tolerable | 391 | 0.33 | Tolerable |
| 6 | 2987 | 0.25 | Tolerable | 158 | 0.13 | Tolerable | 130 | 0.11 | Tolerable |
| 7 | 1567 | 0.13 | Tolerable | 98 | 0.08 | Tolerable | 94 | 0.08 | Tolerable |

### *2021 Background Traffic Conditions Plus Site Traffic*

With the addition of the site-generated traffic to the 2021 background traffic, the V/C ratio is approaching "Moderate" LOM for segments 2, 3, and 4.

| 2021 Background + Site | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 6083 | 0.51 | Tolerable | 467 | 0.39 | Tolerable | 550 | 0.46 | Tolerable |
| 2 | 9414 | 0.78 | Tolerable | 708 | 0.59 | Tolerable | 830 | 0.69 | Tolerable |
| 3 | 9196 | 0.77 | Tolerable | 671 | 0.56 | Tolerable | 846 | 0.71 | Tolerable |
| 4 | 9298 | 0.77 | Tolerable | 693 | 0.58 | Tolerable | 775 | 0.65 | Tolerable |
| 5 | 4685 | 0.39 | Tolerable | 355 | 0.30 | Tolerable | 395 | 0.33 | Tolerable |
| 6 | 3020 | 0.25 | Tolerable | 161 | 0.13 | Tolerable | 132 | 0.11 | Tolerable |
| 7 | 1577 | 0.13 | Tolerable | 99 | 0.08 | Tolerable | 95 | 0.08 | Tolerable |

### *2040 Background Traffic Conditions No Build*

By 2040, segment 2 and 3 is at a "Moderate" LOM for the PM peak hour, and "Serious" LOM for the daily traffic. Segment 4 is at a "Moderate" LOM for the daily traffic.

| 2040 Background No build | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 6948 | 0.58 | Tolerable | 530 | 0.44 | Tolerable | 626 | 0.52 | Tolerable |
| 2 | 13151 | 1.10 | Serious | 971 | 0.81 | Tolerable | 1141 | 0.95 | Moderate |
| 3 | 12433 | 1.04 | Serious | 854 | 0.71 | Tolerable | 1099 | 0.92 | Moderate |
| 4 | 10824 | 0.90 | Moderate | 793 | 0.66 | Tolerable | 893 | 0.74 | Tolerable |
| 5 | 9265 | 0.77 | Tolerable | 699 | 0.58 | Tolerable | 780 | 0.65 | Tolerable |
| 6 | 3885 | 0.32 | Tolerable | 206 | 0.17 | Tolerable | 170 | 0.14 | Tolerable |
| 7 | 5624 | 0.47 | Tolerable | 353 | 0.29 | Tolerable | 338 | 0.28 | Tolerable |

### *2040 Background Traffic Conditions Plus Site Traffic*

The addition of the site build-out traffic increases the V/C ratio, but does not result in changes to the LOM rankings. As seen in the following table, the site generated traffic slightly increases the V/C ratio. The roadway links which are projected to reach the "Moderate" or "Serious" LOM are a result of the continuing background traffic growth.

| 2040 Background + Site | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 7078 | 0.59 | Tolerable | 544 | 0.45 | Tolerable | 640 | 0.53 | Tolerable |
| 2 | 13330 | 1.11 | Serious | 989 | 0.82 | Tolerable | 1161 | 0.97 | Moderate |
| 3 | 13177 | 1.10 | Serious | 928 | 0.77 | Tolerable | 1173 | 0.98 | Moderate |
| 4 | 11338 | 0.94 | Moderate | 844 | 0.70 | Tolerable | 945 | 0.79 | Tolerable |
| 5 | 9314 | 0.78 | Tolerable | 705 | 0.59 | Tolerable | 785 | 0.65 | Tolerable |
| 6 | 3926 | 0.33 | Tolerable | 209 | 0.17 | Tolerable | 172 | 0.14 | Tolerable |
| 7 | 5636 | 0.47 | Tolerable | 354 | 0.30 | Tolerable | 339 | 0.28 | Tolerable |

### *2040 MTP Background Traffic Conditions Plus Site Traffic*

McCombs (segment 1, 2, 3, and 4) is indicated on the MTP as an eight lane super arterial. The following table shows the LOM with the recommended transportation improvements on McCombs.

| 2040 ***MTP*** Background + Site | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Daily | | | AM | | | PM | | |
| Road Segment | V | V/C | LOM | V | V/C | LOM | V | V/C | LOM |
| 1 | 7078 | 0.15 | Tolerable | 544 | 0.11 | Tolerable | 640 | 0.13 | Tolerable |
| 2 | 13330 | 0.28 | Tolerable | 989 | 0.21 | Tolerable | 1161 | 0.24 | Tolerable |
| 3 | 13177 | 0.27 | Tolerable | 928 | 0.19 | Tolerable | 1173 | 0.24 | Tolerable |
| 4 | 11338 | 0.24 | Tolerable | 844 | 0.18 | Tolerable | 945 | 0.20 | Tolerable |
| 5 | 9314 | 0.78 | Tolerable | 705 | 0.59 | Tolerable | 785 | 0.65 | Tolerable |
| 6 | 3926 | 0.33 | Tolerable | 209 | 0.17 | Tolerable | 172 | 0.14 | Tolerable |
| 7 | 5636 | 0.47 | Tolerable | 354 | 0.30 | Tolerable | 339 | 0.28 | Tolerable |

## **Conclusions:**

The segment on McCombs between State Line and Stan Roberts is projected to reach "Serious" LOM approaching the end of life year 2040 as a result of the continuing background traffic growth. With the addition of traffic from the proposed site, the V/C ratio increases slightly, but does not result in changes to the LOM rankings.

If the recommended improvements on McCombs are implemented according to the MTP, then all roadway segments operate at a "Tolerable" LOM.

TxDOT does not have comments to your TIA. FM 2529 (McCombs) does not extend from Stan Roberts to State Line. FM 2529 (McCombs) continues/turns left at Stan Roberts and ends at FM 3255 (MLK).

Edgar,

Our environmental services department is looking to open a land fill on McCombs and Stan Roberts. Attached is a roadway capacity analysis for the surrounding roadway as part of their permit amendment for your review.

Please let me know if you have any comments or need further information.
Thank you for your assistance.

# TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

*Protecting Texas by Reducing and Preventing Pollution*

October 28, 2011

Dear Applicant:

Re: TPDES Multi-Sector General Permit (TXR050000)
Notice of Intent Authorization

Your Notice of Intent application for authorization under the general permit for discharge of storm water associated with industrial activities has been received. Pursuant to authorization from the Executive Director of the Texas Commission on Environmental Quality, the Division Director of the Water Quality Division has issued the enclosed Certificate.

Please refer to the attached certificate for the identification number that was assigned to your project/site and the coverage effective date. Please use this number to reference this project/site for future communications with the Texas Commission on Environmental Quality (TCEQ).

Authorization under the Edwards Aquifer Protection Program is required before construction can begin where the site is located within the Edwards Aquifer Recharge Zone, Contributing Zone, or Contributing Zone within the Transition Zone. See http://www.tceq.state.tx.us/compliance/field_ops/eapp/program.html for additional information.

A Notice of Termination must be submitted when permit coverage is no longer needed. You may obtain a Notice of Termination form at the web site listed below. All authorizations that are active on September 1st of each year will be assessed an annual fee. The Notice of Termination must be postmarked for delivery to TCEQ on or before September 1 to avoid the annual fee assessment.

The billing statement will be mailed to the Operator in January and payment must be made within 30 days to avoid late fees. It is the responsibility of the Operator to notify the TCEQ Storm Water Processing center of any change in address supplied on the original Notice of Intent.

For questions related to the status or processing of your application you may contact the Storm Water Processing Center by email at SWPERMIT@tceq.state.tx.us or by telephone at (512) 239-3700. If you have any questions regarding coverage under this general permit or other technical issues, you may contact the storm water technical staff at (512) 239-4671 or by email at swgp@tceq.state.tx.us. Also, you may obtain information on the storm water web site at www.tceq.state.tx.us. Permit and application status information can be found on the TCEQ web site at http://www5.tceq.state.tx.us/wq_dpa/.

Sincerely,

Charles W. Maguire, Director
Water Quality Division
Texas Commission on Environmental Quality

# TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Texas Pollutant Discharge Elimination System
Storm Water Multi-Sector General Permit

The Notice of Intent (NOI) for the facility listed below was received on September 19, 2011. The intent to discharge storm water associated with industrial activity under the terms and conditions imposed by the Texas Pollutant Discharge Elimination System (TPDES) storm water multi-sector general permit TXR050000 is acknowledged. Your facility's TPDES multi-sector storm water general permit number is:

**TXR05L795**
Coverage Effective: November 26, 2001

TCEQ's storm water multi-sector general permit requires certain storm water pollution prevention and control measures, possible monitoring and reporting, and periodic inspections. Among the conditions and requirements of this permit, you must have prepared and implemented a storm water pollution prevention plan (SWP3) that is tailored to your industrial site. As a facility authorized to discharge under the storm water multi-sector general permit, all terms and conditions must be complied with to maintain coverage and avoid possible penalties.

Project/Site Information:
RN100215599
MCCOMBS LANDFILL
13600 MCCOMBS ST
EL PASO, TX 79934-3307
EL PASO COUNTY

Operator:
CN601410244
CITY OF EL PASO
7968 SAN PAULO DR
EL PASO, TX 79907-1261

This permit expires on August 14, 2016, unless otherwise amended. If you have any questions related to processing you may contact the Storm Water Processing Center by **email at SWPERMIT@tceq.texas.gov or by telephone at (512) 239-3700**. For technical issues, you may contact the storm water technical staff by email at swgp@tceq.texas.gov or by telephone at (512) 239-4671. Also, you may obtain information on the storm water web site at http://www5.tceq.texas.gov/wq_dpa/. A copy of this document should be kept with your SWP3.

| ZONE | EXPLANATION |
|---|---|
| A | Areas of 100-year flood; base flood elevations and flood hazard factors not determined. |
| AO | Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; average depths of inundation are shown, but no flood hazard factors are determined. |
| AH | Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; base flood elevations are shown, but no flood hazard factors are determined. |
| AE,A1-A30 | Areas of 100-year flood; base flood elevations and flood hazard factors determined. |
| A99 | Areas of 100-year flood to be protected by flood protection system under construction; base flood elevations and flood hazard factors not determined. |
| B | Areas between limits of the 100-year flood and 500-year flood; or certain areas subject to 100-year flooding with average depths of less than 1 foot or where the contributing drainage area is less than one square mile; or areas protected by levees from the base flood. (Medium shading) |
| C | Areas of minimal flooding. (No shading) |
| D | Areas of undetermined, but possible, flood hazards. |
| V | Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors not determined. |
| V1-V30 | Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors determined. |

NOTES TO USER

Certain areas not in the special flood hazard areas (Zones A and V) may be protected by flood control structures.

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all planimetric features outside special flood hazard areas. The coastal flooding elevations shown may be higher than those developed by the National Weather Service for hurricane evacuation planning.

For adjoining map panels, see separately printed Index to Map Panels.

RE: McCombs Municipal Solid Waste Landfill Vertical Expansion; El Paso County

Dear Mr. Doran:

Texas Parks and Wildlife Department (TPWD) received the request for information regarding listed threatened or endangered species within or near the above-referenced proposed project. TPWD staff has reviewed the information provided and offers the following comments and recommendations concerning this project.

Please be aware that a written response to a TPWD recommendation or informational comment received by a state governmental agency may be required by state law. For further guidance, see the Texas Parks and Wildlife Code, Section 12.0011, which can be found online at http://www.statutes.legis.state.tx.us/Docs/PW/htm/PW.12.htm#12.0011. For tracking purposes, please refer to TPWD project number 16900 in any return correspondence regarding this project.

Project Description

The proposed project entails the vertical expansion of an existing landfill to increase the height from the currently permitted elevation of 4,125 feet to 4,305 feet. The existing permitted boundary of the landfill is 327 acres and is not proposed to increase. No other information about the proposed project was provided with the request.

Federal Laws

*Endangered Species Act*

Federally-listed animal species and their habitats are protected from "take" on any property by the Endangered Species Act (ESA). Take of a federally-listed species can be allowed if it is "incidental" to an otherwise lawful activity and

4200 SMITH SCHOOL ROAD
AUSTIN, TEXAS 78744-3291
512.389.4800
www.tpwd.state.tx.us

must be permitted in accordance with Section 7 or 10 of the ESA. Federally-listed plants are not protected from take except on lands under federal/state jurisdiction or for which a federal/state nexus (i.e., permits or funding) exists. Any take of a federally-listed species or its habitat without the required take permit (or allowance) from the U.S. Fish and Wildlife Service (USFWS) is a violation of the ESA.

A record of consultation with the USFWS in 1982 was provided with the request. That correspondence addressed potential impacts to species that were listed as threatened or endangered at the time the landfill was constructed. Please note that since 1982 the following species have been listed as threatened or endangered under the ESA and have the potential to occur in El Paso County:

| **Species** | **Date Listed** |
|---|---|
| Least tern (*Sterna antillarum*) | 05/28/1985 |
| Northern Aplomado Falcon (*Falco femoralis septentrionalis*) | 02/25/1986 |
| Mexican Spotted Owl (*Strix occidentalis lucida*) | 03/16/1993 |
| Southwestern Willow Flycatcher (*Empidonax trailii extimus*) | 02/27/1995 |

It is the responsibility of the project proponent to determine if adverse impacts federally-listed species are expected to occur as a result of the proposed project and consult with the appropriate agency concerning those impacts.

**Recommendation:** TPWD recommends SAIC assess the proposed project for potential impacts to species that are protected by the ESA. Brief descriptions of suitable habitats for these species are provided on the attached TPWD El Paso County list. If potential impacts to federally listed species are anticipated, TPWD recommends SAIC contact the USFWS Austin Ecological Services Field office at (512) 490-0057.

*Migratory Bird Treaty Act*

The Migratory Bird Treaty Act (MBTA) prohibits taking, attempting to take, capturing, killing, selling/purchasing, possessing, transporting, and importing of migratory birds, their eggs, parts and nests, except when specifically authorized by the Department of the Interior. This protection applies to most native bird species, including ground nesting species. The US Fish and Wildlife Service (USFWS) Migratory Bird Office can be contacted at (505) 248-7882 for more information on potential impacts to migratory birds.

**Recommendation:** If migratory bird species are found nesting on or adjacent to the project area, they must be dealt with in a manner consistent with the MBTA. TPWD recommends excluding vegetation clearing activities during the general bird nesting season, March through August, to avoid adverse impacts to this group. If clearing vegetation during the migratory bird nesting season is unavoidable, TPWD recommends the facility survey the area proposed for disturbance to ensure that no nests with eggs or young will be disturbed by operations. Any vegetation (trees, shrubs, and grasses) where occupied nests are located should not be disturbed until the eggs have hatched and the young have fledged.

State Laws

*Parks and Wildlife Code, Section 68.015*

Section 68.015 of the Parks and Wildlife Code regulates state-listed species. Please note that there is no provision for take (incidental or otherwise) of state-listed species. A copy of *TPWD Guidelines for Protection of State-Listed Species*, which includes a list of penalties for take of species, is attached for your reference. State-listed species may only be handled by persons with a scientific collection permit obtained through TPWD. For more information on this permit, please contact the Wildlife Permits Office at (512) 389-4647.

Sparse vegetation consisting of grass, cactus, and scattered brush possibly found in the project area could potentially support the following state-listed threatened species:

- Texas horned lizard (*Phrynosoma cornutum*)
- Mountain short-horned lizard (*P. hernandesi*).

An additional indication of suitable habitat for the Texas horned lizard would be the presence of its primary food source, the Harvester ant (*Pogonomyrmex* sp.). Texas horned lizards and Mountain short-horned lizards are generally active in this part of Texas from March through September.

**Recommendation:** TPWD recommends avoiding disturbance of the Mountain short-horned lizard, Texas horned lizard, and colonies of the Harvester ant during clearing and construction. TPWD recommends a biological monitor be present during construction to try to relocate protected species if found. If the presence of a biological monitor during construction is not feasible, state-listed threatened species observed during construction should be allowed to safely leave the site.

A mixture of cover, food sources, and open ground is important to the Mountain short-horned lizard, Texas horned lizard, and Harvester ant. Disturbed areas within suitable habitat for these species should be revegetated with site-specific native, patchy vegetation rather than sod-forming grasses. TPWD recommends review and implementation of the attached monitoring and management guidelines for horned lizards.

Species of Concern

In addition to state- and federally-protected species, TPWD tracks special features, natural communities, and rare species that are not listed as threatened or endangered. These species and communities are tracked in the Texas Natural Diversity Database (TXNDD), and TPWD actively promotes their conservation. TPWD considers it important to evaluate and, if necessary, minimize impacts to rare species and their habitat to reduce the likelihood of endangerment.

Based on the project description, site location, a review of the TXNDD, and publicly-available aerial photographs, the following species of concern could be impacted as a result of the proposed project:

- Western Burrowing Owl (*Athene cunicularia hypugaea*)
- Desert night-blooming cereus (*Peniocereus greggii* var *greggii*)

A record of the Desert night-blooming cereus has been documented possibly within 1.5 miles of the project site. A printout of this occurrence record is attached for your reference.

**Recommendation:** If during construction the project area is found to contain rare species, natural plant communities, or special features, TPWD recommends that precautions be taken to avoid impacts to them.

Western Burrowing Owls reside primarily in open areas with short vegetation and bare ground, sometimes including areas near human habitation. They are dependent on the presence of fossorial (digging and burrowing) mammals, such as prairie dogs and ground squirrels, whose burrows are used for nesting and roosting. Burrowing owls residing in El Paso and surrounding counties are not only summer (breeding) residents but many owls stay in the El Paso region as winter residents. As stated above, the MBTA prohibits the intentional and unintentional take of migratory birds (including ground nesting species), their nests, and eggs. If mammal burrows would be disturbed as a result of the proposed project, TPWD recommends they be surveyed for burrowing owls. If nesting owls are found, disturbance should be avoided until the eggs have hatched and the young have fledged.

Please note that absence of TXNDD information in an area does not imply that a species is absent from that area. Given the small proportion of public versus private land in Texas, the TXNDD does not include a representative inventory of rare resources in the state. Although it is based on the best data available to TPWD regarding rare species, the data from the TXNDD do not provide a definitive statement as to the presence, absence or condition of special species, natural communities, or other significant features within your project area. These data are not inclusive and **cannot be used as presence/absence data.** They represent species that could potentially be in your project area. This information cannot be substituted for on-the-ground surveys. The TXNDD is updated continuously. As the project progresses and for future projects, please request the most current and accurate information at txndd@tpwd.state.tx.us.

**Recommendation:** Please review the attached TPWD county list of rare and protected species for El Paso County, as rare species in addition to those discussed above could be present depending upon habitat availability. These lists are also available online at http://www.tpwd.state.tx.us/landwater/land/maps/gis/ris/endangered_species/. The USFWS should be contacted for species occurrence data, guidance, permitting, survey protocols, and mitigation for federally listed species. For the USFWS rare species lists by county please visit http://www.fws.gov/endangered/.

Determining the actual presence of a species in a given area depends on many variables including daily and seasonal activity cycles, environmental activity cues, preferred habitat, transiency and population density (both wildlife and human). The absence of a species can be demonstrated only with great difficulty and then only with repeated negative observations, taking into account all the variable factors contributing to the lack of detectable presence. If encountered during construction, measures should be taken to avoid impacting wildlife.

I appreciate the opportunity to review and comment on this project. Please call me at (512) 389-4579 if we may be of further assistance.

Sincerely,

Julie C. Wicker

Protection of State-Listed Species
Texas Parks and Wildlife Department Guidelines

## Protection of State-Listed Species

State law prohibits any take (incidental or otherwise) of state-listed species. State-listed species may only be handled by persons possessing a **Scientific Collecting Permit** or a **Letter of Authorization** issued to relocate a species.

- **Section 68.002 of the Texas Parks and Wildlife (TPW) Code** states that species of fish or wildlife indigenous to Texas are endangered if listed on the United States List of Endangered Native Fish and Wildlife or the list of fish or wildlife threatened with statewide extinction as filed by the director of Texas Park and Wildlife Department. Species listed as Endangered or Threatened by the Endangered Species Act are protected by both Federal and State Law. The State of Texas also lists and protects additional species considered to be threatened with extinction within Texas.

- **Animals** - Laws and regulations pertaining to state-listed endangered or threatened animal species are contained in **Chapters 67 and 68 of the Texas Parks and Wildlife (TPW) Code** and **Sections 65.171 - 65.176 of Title 31 of the Texas Administrative Code (TAC).** State-listed animals may be found at **31 TAC §65.175 & 176.**

- **Plants** - Laws and regulations pertaining to endangered or threatened plant species are contained in **Chapter 88 of the TPW Code and Sections 69.01 - 69.9 of the TAC.** State-listed plants may be found at **31 TAC §69.8(a) & (b).**

## Prohibitions on Take of State Listed Species

**Section 68.015 of the TPW Code** states that no person may capture, trap, take, or kill, or attempt to capture, trap, take, or kill, endangered fish or wildlife.

**Section 65.171 of the Texas Administrative Code** states that except as otherwise provided in this subchapter or **Parks and Wildlife Code, Chapters 67 or 68,** no person may take, possess, propagate, transport, export, sell or offer for sale, or ship any species of fish or wildlife listed by the department as endangered or threatened.

"Take" is defined in **Section 1.101(5) of the Texas Parks and Wildlife Code** as:

> *"Take," except as otherwise provided by this code, means collect, hook, hunt, net, shoot, or snare, by any means or device, and includes an attempt to take or to pursue in order to take.*

## Penalties

The penalties for take of state-listed species **(TPW Code, Chapter 67 or 68)** are:

- 1ST Offense = Class C Misdemeanor:
  $25-$500 fine

- One or more prior convictions = Class B Misdemeanor
  $200-$2,000 fine and/or up to 180 days in jail.

- Two or more prior convictions = Class A Misdemeanor
  $500-$4,000 fine and/or up to 1 year in jail.

Restitution values apply and vary by species. Specific values and a list of species may be obtained from the TPWD Wildlife Habitat Assessment Program.

## WHAT'S HAPPENED TO ALL THE HORNY TOADS?

Everyone loves horny toads, but for many Texans, the fierce-looking, yet amiable, reptiles are only a fond childhood memory. Once common throughout most of the state, horned lizards have disappeared from many parts of their former range.

A statewide survey conducted by the Horned Lizard Conservation Society in 1992 confirmed many Texans' personal experiences—in the latter part of the 20th century the Texas Horned Lizard nearly disappeared from the eastern third of Texas and many respondents reported that horned lizards were increasingly rare in Central and North Texas. Only in West and South Texas do populations seem somewhat stable.

Many factors have been proposed as culprits in the disappearance of horned lizards, often fondly called "horny toads," including collection for the pet trade, spread of the red imported fire ant, changes in agricultural land use, habitat loss and fragmentation as a result of urbanization, and environmental contaminants. For the most part, however, the decline of horned lizards has remained a mystery with little understanding of management actions that could be taken to reverse it. Even less is known about the status of our other two horned lizard species—the Round-tailed Horned Lizard and the Greater Short-horned Lizard.

But you can help! Through participation in Texas Horned Lizard Watch as a citizen scientist, you can collect data and observations about the presence or absence of horned lizards and habitat characteristics on your monitoring site. The data you provide to TPWD, ***even if you don't find horned lizards***, will help us understand how they are doing and offer some insights for people wishing to manage habitats for horned lizards. If you are a property owner, then keeping these management guidelines in mind can help you to enhance or perhaps even recruit horned lizard populations on your property, while at the same time benefitting other native wildlife. There's something everyone can do to help out horny toads!

# ABOUT HORNED LIZARDS

## Appearance

Horned lizards are named for the crown of horns found on their heads, the size and number of which vary among species. Although often called horned toads, horny toads, or even horned frogs because of their wide, flattened bodies (their scientific name *Phrynosoma* actually means "toad-body"), they are not amphibians like other toads, but are reptiles with scales, claws and young produced on land. More than a dozen different species of horned lizards are found throughout western North America.

Three horned lizard species call Texas home, with the most widespread being the Texas Horned Lizard, or the familiar "horny toad." The geographic range of these species can overlap in West Texas, but they can each be readily distinguished from each other by the following characteristics.

LEE ANN LINAM

D. MARTIN

D. MARTIN

### Texas Horned Lizard

*Phrynosoma cornutum*

**Horns** – two prominent horns at the rear and center of the skull
**Scales** – two rows of spiky fringe scales on the side of the body
**Coloring** – gray to brown to rust, with dark spots in rows down the back, a light central stripe, and dark lines radiating from the eye.
**Length** – 3.5 to 5 inches
**Range** – most of Texas, though now nearly gone from the eastern third

### Round-tailed Horned Lizard

*Phrynosoma modestum*

**Horns** – four horns of medium length lined up on the back of the head
**Scales** – few enlarged scales on the body, sides without spiky fringe
**Coloring** – white to gray, brown or pink, with dark blotches at the legs and neck; bands on tail
**Length** – 3 to 4 inches
**Range** – rocky areas in the western third of Texas

### Greater Short-horned Lizard

*Phrynosoma hernandesi*

**Horns** – robust head that is wider than long and heart-shaped, back of the head is tipped only with small horns
**Scales** – one row of spiky fringe scales along the side of the body
**Coloring** – variable colors and patterns ranging from simple brown or grey to intricate patterns of bright colors including orange, yellow, white, red, blue and green
**Length** – 3.5 to 6 inches
**Range** – only higher elevations, in the forests of the Davis and Guadalupe mountains of West Texas

## TEXAS SPINY LIZARD

Another similar group of lizards occurs in Texas, the spiny lizards. Spiny lizards are sometimes confused with horned lizards because of the spiky scales found on their bodies and heads; however, the spiny lizards are much more slender with a longer tail. In addition, they tend to spend more time climbing, whereas horned lizards spend most of their time on the ground.

## Life History

Horned lizards are usually found in flat, open terrain, with sparse plant cover, although in the eastern portion of their distribution, vegetation cover may be somewhat thicker. They utilize mammal burrows, rock piles or clumps of vegetation for cover and may excavate shallow burrows in loose soils or scoop out a shallow depression in which to hide.

Horned lizards primarily eat harvester ants (also called big red ants), but their diet also includes termites, other native ants, other insects, spiders and sowbugs. Horned lizards or their droppings can sometimes be found near the beds of harvester ants, and an individual can consume 70–100 ants per day (one reason they are difficult to maintain in captivity!).

Horned lizards require warm temperatures to stimulate their appetite and activity. They sometimes begin their day by exposing only their heads to sunlight while keeping their bodies buried. Later, they will often be seen in a flattened body posture sunning themselves in open areas. They are not usually active at night or when temperatures fall below 75° F. In general, they are seen only in late spring through early fall and tend to hibernate a few inches underground from September/October to March/April.

Mating occurs soon after emergence from hibernation. The female digs a hole 6 to 8 inches deep and lays 13 to 50 eggs (6 to 18 for Round-tailed Horned Lizards), which are incubated by the warmth of the soil. Depending on ground temperatures, young horned lizards about 3/4-inch in length may begin to hatch 5 to 9 weeks later. The Greater Short-horned Lizard, which lives in cooler, higher-altitude climates, is unique among our species in giving birth to live young!

Texas Horned Lizards and Short-horned Lizards may live 5 to 8 years, while Round-tailed Horned Lizards are thought to live only 2 to 3 years. Although snakes, mammals and birds prey on them, horned lizards have developed some unique defenses. Their spiky appearance and coloration help Texas and Short-horned lizards to blend into the local vegetation, while the color and shape of the Round-tailed Horned Lizard actually help it to look like a rock! In addition to the deterrence that the horns on the head may provide to predators, horned lizards can inflate themselves to a larger apparent size or may tilt their body to appear larger. Finally, the horned lizard is renowned for its ability to shoot

## WHAT ARE HARVESTER ANTS?

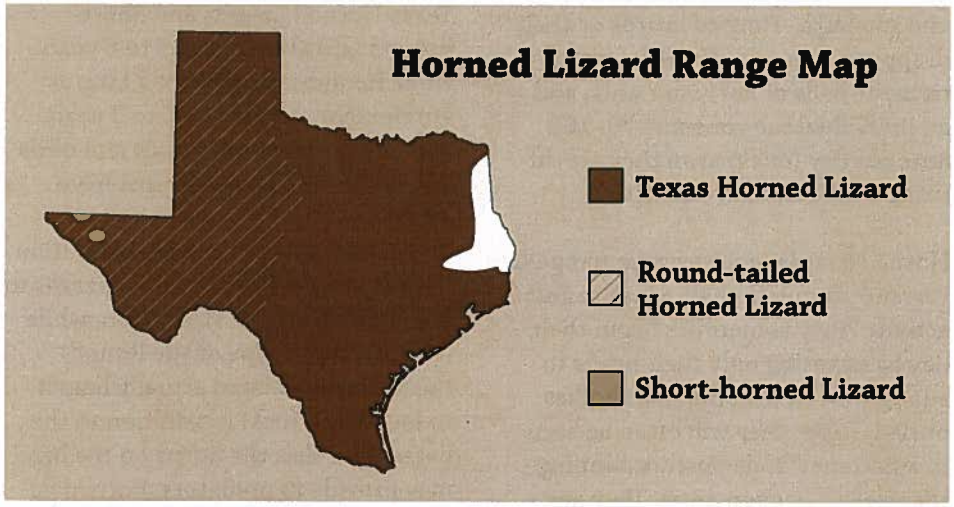
Harvester ants belong to the genera *Pogonomyrmex* or *Ephebomyrmex*. Twelve species of harvester ants are found in Texas, and the Red Harvester Ant (*Pogonomyrmex barbatus*) is the most widespread. Red harvester ants are easily identified by their large size (up to a half inch) and generally conspicuous mound. These ants clear vegetation, forming a large circular pattern of bare ground around their nest. This bare ground is often covered with small pebbles dug from within the nest itself. The mound usually has one main entrance/exit hole in the center of the cleared area. Extending in various directions from the main mound are foraging trails leading to various foraging zones. Harvesters, as the name implies, harvest seeds. Grass seeds make up the majority of their diet, and the husks of harvested seeds often surround harvester ant mounds.

MAYO

a stream of blood from its eye when under extreme stress (actually from ruptured blood vessels in the sinuses near the eyes). A chemical in the blood is especially distasteful to canine predators. Texas Horned Lizards and Short-horned Lizards are known to engage in blood-squirting, while the Round-tailed Horned Lizard does not.

Sometimes a horned lizard sign such as scat (or droppings) is much more visible than the species itself. Horned lizard scat is a dark brown oblong pellet that is straight or slightly curved. A white uric acid tip is often very prominent. Ant heads and other body parts are noticeable in the scat, especially when the scat is broken apart. The scat usually looks very large in relation to the lizard from which it came, ranging from 1/2 to 1-1/2 inches in length and 1/4 to 3/8 inch in diameter. Scat of other lizards have the uric acid tip; however, the shape of the scat is much less symmetrical and it will not contain a high percentage of ants.

NEWSOM



## Protected Status

Texans have a long history of concern for horned lizards. In 1967, the state legislature protected Texas Horned Lizards from the pet trade (horned lizards do not survive well in captivity), and in 1977, Texas Parks and Wildlife Department placed both the Texas Horned Lizard and the Greater Short-horned Lizard on the state threatened species list. In 1993, a group of schoolchildren successfully petitioned the Texas Legislature to name the Texas Horned Lizard the official state reptile. Though not listed as threatened or endangered, Round-tailed Horned Lizards receive some attention/regulation through the state's nongame permit process.

# MANAGEMENT OF HORNED LIZARDS

Many Texans are interested in having more horned lizards on their property. Although many people inquire about translocating or breeding horned lizards for release, unfortunately, initial research has not been very successful with these efforts and additional conservation questions need to be answered. In addition, because Texas Horned Lizards and Short-horned Lizards are listed as threatened species, anyone handling these species or attempting to do this must obtain a scientific permit. Horned lizards cannot survive and thrive without appropriate habitat, and probably the best strategy for bringing back horned lizards is to first restore or create suitable habitat that can support and conserve native ant populations as well as horned lizards.

Horned lizards in Texas can be found in a variety of habitats; however, researchers have noted several similarities among occupied habitat.

- First, horned lizards tend to be found in "patchy" habitat that is characterized by areas of bare ground (~40 percent) interspersed with native vegetation. This open ground allows horned lizards room for movement and basking, and it provides ants open areas for colony establishment.
- Second, Texas Horned Lizards seem to prefer sandy loam soils that are more than 2/3 sand and less than 15 percent clay. Loose, well-drained soils are more suitable for burrowing, hibernating and nesting.
- Third, horned lizards in Texas are usually found where native ants are abundant. Harvester (or "red") ants in the genus *Pogonomyrmex* are often very evident, although horned lizards also eat other native ants and insects.

One horned lizard can use five to six acres of habitat over the course of its activities, often feeding at a number of different harvester ant mounds. There is a minimal amount of overlap with other adult horned lizards. A viable population of horned lizards may thus require a substantial amount of suitable habitat.

## MANAGEMENT GUIDELINES

**The following management guidelines for horned lizards are adapted from a 1998 publication, *Management of Texas Horned Lizards*, written by Scott E. Henke and Wm. Scott Fair, and published by the Caesar Kleberg Wildlife Research Institute of Texas A&M University–Kingsville as Wildlife Management Bulletin No. 2.**

1. **Develop and maintain a habitat that contains a diversity of native plant species –** A diverse community of native plants will attract a diverse community of invertebrates. Such a variety of insects may be especially important to juvenile horned lizards. If you are interested in reclaiming a previous agricultural area or in landscaping at your residence, focus on native bunchgrasses, such as bluestems, forbs and shrubs. Bunchgrasses form clumps that allow horned lizards to easily move among the grass clumps; whereas carpet grasses form a thick mat that can impede horned lizard movement. Native grasses also produce seeds that are good food sources for harvester ants.

2. **Create a mosaic habitat of open areas intermixed within more dense cover –** Such a patchy environment will give horned lizards areas in which to warm or cool themselves, allow them room for movement, and offer sufficient escape cover from predators. You may also wish to create 1-square-yard areas devoid of any vegetation and ground litter. These spots may serve as valuable basking areas for horned lizards, and newly fertilized harvester ant queens need bare ground in which to establish new colonies. Grazing, burning, mowing, and scraping can help create and maintain the mosaic habitat desired.

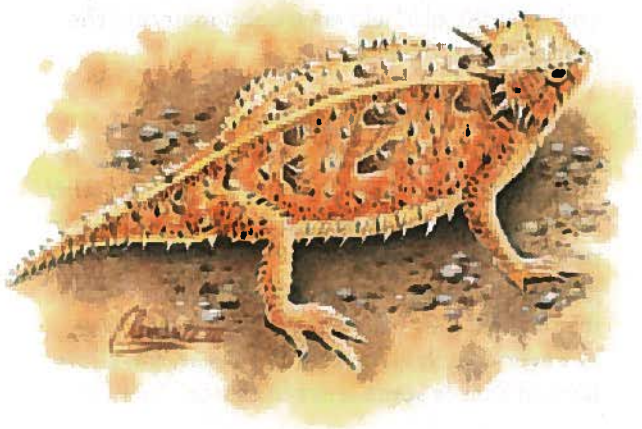
3. **Use prescribed fires to remove ground litter** – Horned lizards usually avoid areas with substantial dead vegetation on the ground (also called litter) because the litter can impede their movement. Burning is a useful tool to decrease ground litter and create open ground. Burning in small patches on a rotational basis, so that not every patch is burned every year, can allow horned lizards some areas to escape. In addi-

tion, conducting burns during the cool season (late winter/early spring) results in cooler fires, and research suggests that hibernating lizards can survive such fires while burrowed underground. Local Natural Resource Conservation Service staff can provide site-specific guidance on prescribed burning.

4. **Avoid overgrazing by livestock** – Horned lizards do not appear to be negatively affected by low to moderate grazing of livestock, and grazing may help increase some plant diversity and open areas. On the other hand, very heavy stocking rates can reduce needed cover and result in direct mortality of horned lizards. Use of a rotational grazing scheme can help create the desired mosaic of open areas and vegetative cover.

5. **Avoid road maintenance and limit traffic during the horned lizard active season** – Horned lizards make frequent use of roadsides, especially unpaved secondary roads, for basking, resting, and bedding sites. If possible, avoid disking or grading roads between mid-March and mid-October. In addition, vehicular strikes can be a significant mortality factor for horned lizards. Slower speeds and caution should be exhibited during the active season for horned lizards, especially in the mornings and late afternoons. If drivers are cautious, however, road-cruising can be a valuable way to survey horned lizard populations.

6. **Avoid the use of broadcast pesticides** – Pesticides could kill horned lizards directly by accumulating toxins within their body or indirectly by killing harvester ants and other valuable insects. If pesticides are needed, then spot treatment is recommended rather than broadcast application.



7. **Manage ant populations** – Findings from Texas Horned Lizard Watch indicate that efforts should be made to encourage native ant populations and discourage red imported fire ants. The first step should be to reduce red imported fire ant populations; however, fire ant control methods should be chosen carefully, as some pesticides used to kill fire ants can also kill native ants and other insects. In a small area, individual fire ant mound treatments, either with pesticides, organic mixes or soapy boiling water, can be used. When baits are used, application late in the day on the fire ant mound can increase the chances that fire ants will pick up bait and native ants will not. On larger acreages or with severe infestations, a broadcast treatment may be needed; however, steps can be taken to minimize the impact of such treatments on native ants. Try to find a bait that uses an active ingredient, such as Spinosad, that does not affect harvester ants. Several researchers suggest placing broadcast pesticides in small containers, such as film canisters that have small holes drilled in the container or its lid. The holes should be no larger than 1/16-inch in diameter so that fire ants can enter the container, but harvester ants cannot.

   As noted above, native ants can be encouraged by establishing native grasses and scattered patches of bare ground. Some landowners also choose to "feed" their harvester ant populations by providing native seed, oat flakes, crushed peanuts, or similar items within the foraging area of the mound.

8. **Remove feral domesticated predators** – Feral cats and dogs, along with pets, are predators of horned lizards. Keep pets from "hunting" in horned lizard habitat. Feral animals can be removed; you may wish to contact the Humane Society for assistance or suggestions. Keep in mind that wild avian predators, such as roadrunners or shrikes, are protected by federal law and cannot be killed or trapped; however, providing plenty of escape cover can help horned lizards survive among these natural predators.

# HOW TO MONITOR HORNED LIZARDS

**There are two ways you can participate in Texas Horned Lizard Watch, either by searching a site or setting up a transect. Please note that each survey type has its own unique data form.**

## Site Surveys

Site surveys can take place anywhere, from your backyard to your hunting ranch to your favorite state park. The enclosed data sheet asks you to provide information about the site location and its habitat and then provides a table where you can list information about each horned lizard (or horned lizard scat) seen. Feel free to submit maps or photos to supplement your information and to make copies of the data sheet if needed. You can survey as many different sites as you like; simply fill out a separate site form for each site.

For best results, we recommend that you visit your site at least five times between May and September; however, we are happy to accept data from sites that you visit less often. You can even fill out this form when you happen to spot a horned lizard by chance. Simply let us know how many hours you spent visiting the site, so that we can get an idea of the survey effort.

## Transects

Transects are a more quantitative method for monitoring species and require a more formal survey effort. The benefits of transects are that we can convert results to density estimates and thus compare horned lizard populations at different sites.

To conduct a Texas Horned Lizard transect you need to set up a route that is at least 3 miles long. The route can follow unpaved roads or trails or be of your own design. Walk, ride or drive the route, recording all Texas horned lizards and ant beds that occur within 3 feet of your route on either side. (If driving, be sure to keep speeds under 15 mph and stop and check the identification of any horned lizards seen.) Mark your transect location on a map if possible. Transects should be conducted at least five times between May and September if possible.

## Submitting Data

Data forms can be mailed, faxed, or scanned and e-mailed. We would like to receive your datasheet *even if you do not see horned lizards*. Not finding horned lizards is as important as finding them, because that helps us understand the types of sites or conditions where horned lizards are missing.

## Additional Monitoring Notes

Certain conditions apply to both methods. You should try to make sure that your surveys are conducted under sunny, or partly sunny, dry weather conditions when temperatures are 80-95° F and winds are light or moderate. One good indicator of horned lizard activity is to check to see whether harvester ants are active. Ideally, your five survey efforts should be at least several weeks apart (although you may conduct additional surveys more frequently). If you do visit a site more frequently, then you may want to collect any horned lizard scat you encounter so that you don't recount it on subsequent visits. Scat can also be sent in with your data sheets as verification.

The Texas Horned Lizard and the Short-horned Lizard are listed as threatened by Texas Parks and Wildlife, primarily to protect them from commercial exploitation. Because of this designation, you should not collect or move horned lizards that you encounter on your survey efforts.

Finally, be sure to send in your survey forms, even if you do not see any horned lizards. If you have any uncertainty about identification of the lizards or scat you see, don't hesitate to take a photo and send it to us.

### IMPORTANT:

### ABOUT THE LANDOWNER ACCESS REQUEST FORM

Texas Parks and Wildlife cannot use data collected from private land unless written permission is received from the landowner.

All Texas Horned Lizard Watch volunteers must send in a completed Landowner Access Request Form for any data collected from private land. This applies even if you are monitoring your own property.

Please respect the rights of private property owners during the course of your volunteer efforts.

TEXAS PARKS & WILDLIFE

**Texas Horned Lizard Watch**

# Landowner Access Request Form

To the landowner:

_____ (volunteer name) is participating as a volunteer in Texas Horned Lizard Watch. Texas Horned Lizard Watch is a monitoring program that uses citizen volunteers to gather data about the status and health of our state reptile. Texas Parks and Wildlife is very pleased to have the assistance of concerned Texans in watching over the health of the horny toad.

We have, however, instructed our volunteers that they cannot collect data on private land without the approval of the private landowner. Accordingly, we have prepared this form for your approval. The sections described below are the releases that we and our volunteers are required to obtain from you under Section 12.103 of the Texas Parks and Wildlife Code. If you are willing, then please sign one or both sections and provide a copy to our volunteer.

1. **Use of information**
   This documents my approval for TPWD volunteers and employees to use site-specific information from the property I own or manage. This may include placing that information onto a topographic map and entering the information into a department database. Thus, the information could be viewed by the public.

   _____ _____
   (Landowner or authorized agent signature) (Date)

2. **Reporting information**
   This also documents my approval for TPWD volunteers and employees to report (such as in publications or technical reports) the above approved information in a manner that permits identification of the location of the specific parcel of property that I own or manage.

   _____ _____
   (Landowner or authorized agent signature) (Date)

3. **Other Conditions**
   If there are any conditions that apply to this approval, please specify and initial below.

   _____
   _____
   _____

**Name and Address:** (of landowner or authorized agent)

Name _____
Address _____
City/ST/Zip _____
Phone _____
Phone _____

**Optional:**

Ranch or Tract Name _____
_____
County _____

## NONGAME AND ENDANGERED SPECIES CONSERVATION FUND

The "Special Fund" was created by the Texas Legislature in 1983 to underwrite the conservation and management work performed on Texas' nongame and endangered wildlife. This fund, sustained entirely by voluntary contributions, has provided support for a variety of projects benefiting nongame and endangered species. For more information on this fund, call the TPWD Wildlife Diversity program at (800) 792-1112.

Texas conservation license plates help fund conservation efforts in the state. The most popular plate features a Texas horned lizard and provides funding for wildlife diversity projects, including horned lizard research. **http://conservation-plate.org/**

## LEGAL STATUS AND CONSERVATION RANKS

**FEDERAL STATUS** (as determined by the US Fish and Wildlife Service)

| | |
|---|---|
| **LE** | Listed Endangered |
| **LT** | Listed Threatened |
| **PE** | Proposed to be listed Endangered |
| **PT** | Proposed to be listed Threatened |
| **PDL** | Proposed to be Delisted (Note: Listing status retained while proposed) |
| **SAE, SAT** | Listed Endangered on basis of Similarity of Appearance, Listed Threatened on basis of Similarity of Appearance |
| **DL** | Delisted Endangered/Threatened |
| **C** | Candidate. USFWS has substantial information on biological vulnerability and threats to support proposing to list as threatened or endangered. Data are being gathered on habitat needs and/or critical habitat designations. |
| **C*** | C, but lacking known occurrences |
| **C**** | C, but lacking known occurrences, except in captivity/cultivation |
| **XE** | Essential Experimental Population |
| **XN** | Non-essential Experimental Population |
| **Blank** | Species is not federally listed |

**TX PROTECTION** (as determined by the Texas Parks and Wildlife Department)

| | |
|---|---|
| **E** | Listed Endangered |
| **T** | Listed Threatened |
| **Blank** | Species not state-listed |

**GLOBAL RANK** (as determined by NatureServe)

| | |
|---|---|
| **G1** | Critically imperiled globally, extremely rare, typically 5 or fewer viable occurrences |
| **G2** | Imperiled globally, very rare, typically 6 to 20 viable occurrences |
| **G3** | Very rare and local throughout range or found locally in restricted range, typically 21 to 100 viable occurrences |
| **G4** | Apparently secure globally |
| **G5** | Demonstrably secure globally |
| **GH** | Of historical occurrence through its range |
| **GU** | Possibly in peril range-wide, but status uncertain |
| **G#G#** | Ranked within a range as status uncertain |
| **GX** | Apparently extinct throughout range |
| **Q** | Rank qualifier denoting taxonomic assignment is questionable |
| **#?** | Rank qualifier denoting uncertain rank |
| **C** | In captivity or cultivation only |
| **G#T#** | "G" refers to species rank; "T" refers to variety or subspecies rank |

**STATE (SUBNATIONAL) RANK** (as determined by the Texas Parks and Wildlife Department)

| | |
|---|---|
| **S1** | Critically imperiled in state, extremely rare, vulnerable to extirpation, typically 5 or fewer viable occurrences |
| **S2** | Imperiled in state, very rare, vulnerable to extirpation, typically 6 to 20 viable occurrences |
| **S3** | Rare or uncommon in state, typically 21 to 100 viable occurrences |
| **S4** | Apparently secure in State |
| **S5** | Demonstrably secure in State |
| **S#S#** | Ranked within a range as status uncertain |
| **SH** | Of historical occurrence in state and may be rediscovered |
| **SU** | Unrankable – due to lack of information or substantially conflicting information |
| **SX** | Apparently extirpated from State |
| **SNR** | Unranked – State status not yet assessed |
| **SNA** | Not applicable – species id not a suitable target for conservation activities |
| **?** | Rank qualifier denoting uncertain rank in State |

Revised 1 Apr 2008

## ELEMENT OCCURRENCE RECORD

**Element Occurrence Record (EOR)** Spatial and tabular record of an area of land and/or water in which a species, natural community, or other significant feature of natural diversity is, or was, present and associated information; may be a single contiguous area or may be comprised of discrete patches or subpopulations

**Occurrence #** Unique number assigned to each occurrence of each element when added to the NDD

## LOCATION INFORMATION

**Watershed Code** Eight digit numerical code determined by US Geological Survey (USGS)

**Watershed** Name of watershed as determined by USGS

**Quadrangle** Name of USGS topographical map

**Directions** Directions to geographic location where occurrence was observed, as described by observer or in source

## SURVEY INFORMATION

**First/Last Observation** Date a particular occurrence was first/last observed; refers only to species occurrence as noted in source and does not imply the first/last date the species was present

**Survey Date** If conducted, date of survey

**EO Type** State rank qualifiers:

- **M** Migrant – species occurring regularly on migration at staging areas, or concentration along particular corridors; status refers to the transient population in the State
- **B** Qualifier indicating basic rank refers to the breeding population in State
- **N** Qualifier indicating basic rank refers to the non-breeding population in State

**EO Rank**

| | | | |
|---|---|---|---|
| **A** | Excellent | **AI** | Excellent, Introduced |
| **B** | Good | **BI** | Good, Introduced |
| **C** | Marginal | **CI** | Marginal, Introduced |
| **D** | Poor | **DI** | Poor, Introduced |
| **E** | Extant/Present | **EI** | Extant, Introduced |
| **H** | Historical/No Field Information | **HI** | Historical, Introduced |
| **X** | Destroyed/Extirpated | **XI** | Destroyed, Introduced |
| **O** | Obscure | **OI** | Obscure, Introduced |

**EO Rank Date** Latest date EO rank was determined or revised

**Observed Area** Acres, unless indicated otherwise

## COMMENTS

**Description** General physical description of area and habitat where occurrence is located, including associated species, soils, geology, and surrounding land use

**Comments** Comments concerning the quality or condition of the element occurrence at time of survey

**Protection Comments** Observer comments concerning legal protection of the occurrence

**Management Comments** Observer comments concerning management recommendations appropriate for occurrence conservation

## DATA

**EO Data** Biological data; may include number of individuals, vigor, flowering/fruiting data, nest success, behaviors observed, or unusual characteristic, etc.

## SITE

**Site Name** Title given to site by surveyor

## MANAGED AREA INFORMATION

**Managed Area Name** Place name or (on EOR printout) name of area when the EO is located within or partially within an area identified for conservation, such as State or Federal lands, nature preserves, parks, etc.

**Alias** Additional names the property is known by

**Acres** Total acreage of property, including non-contiguous tracts

**Manager** Contact name, address, and telephone number for area or nearest area land steward

Please use one of the following citations to credit the source for the printout information:

Texas Natural Diversity Database. [year of printouts]. Wildlife Diversity Program of Texas Parks & Wildlife Department. [day month year of printouts].

Texas Natural Diversity Database. [year of printouts]. Element occurrence printouts for [scientific name] *records # [occurrence number(s)]. Wildlife Diversity Program of Texas Parks & Wildlife Department. [day month year of printouts]. *Use of record #'s is optional.

Revised 1 Apr 2008

# EL PASO COUNTY

## AMPHIBIANS

| | | Federal Status | State Status |
|---|---|---|---|
| **Northern leopard frog** | *Rana pipiens* | | |

streams, ponds, lakes, wet prairies, and other bodies of water; will range into grassy, herbaceous areas some distance from water; eggs laid March-May and tadpoles transform late June-August; may have disappeared from El Paso County due to habitat alteration

## BIRDS

| | | Federal Status | State Status |
|---|---|---|---|
| **American Peregrine Falcon** | *Falco peregrinus anatum* | DL | T |

year-round resident and local breeder in west Texas, nests in tall cliff eyries; also, migrant across state from more northern breeding areas in US and Canada, winters along coast and farther south; occupies wide range of habitats during migration, including urban, concentrations along coast and barrier islands; low-altitude migrant, stopovers at leading landscape edges such as lake shores, coastlines, and barrier islands.

| | | | |
|---|---|---|---|
| **Arctic Peregrine Falcon** | *Falco peregrinus tundrius* | DL | |

migrant throughout state from subspecies' far northern breeding range, winters along coast and farther south; occupies wide range of habitats during migration, including urban, concentrations along coast and barrier islands; low-altitude migrant, stopovers at leading landscape edges such as lake shores, coastlines, and barrier islands.

**Baird's Sparrow** *Ammodramus bairdii*

shortgrass prairie with scattered low bushes and matted vegetation; mostly migratory in western half of State, though winters in Mexico and just across Rio Grande into Texas from Brewster through Hudspeth counties

**Ferruginous Hawk** *Buteo regalis*

open country, primarily prairies, plains, and badlands; nests in tall trees along streams or on steep slopes, cliff ledges, river-cut banks, hillsides, power line towers; year-round resident in northwestern high plains, wintering elsewhere throughout western 2/3 of Texas

| | | | |
|---|---|---|---|
| **Interior Least Tern** | *Sterna antillarum athalassos* | LE | E |

subspecies is listed only when inland (more than 50 miles from a coastline); nests along sand and gravel bars within braided streams, rivers; also know to nest on man-made structures (inland beaches, wastewater treatment plants, gravel mines, etc); eats small fish and crustaceans, when breeding forages within a few hundred feet of colony

| | | | |
|---|---|---|---|
| **Mexican Spotted Owl** | *Strix occidentalis lucida* | LT | T |

remote, shaded canyons of coniferous mountain woodlands (pine and fir); nocturnal predator of mostly small rodents and insects; day roosts in densely vegetated trees, rocky areas, or caves

**Montezuma Quail** *Cyrtonyx montezumae*

open pine-oak or juniper-oak with ground cover of bunch grass on flats and slopes of semi-desert mountains and hills; travels in pairs or small groups; eats succulents, acorns, nuts, and weed seeds, as well as various invertebrates

# EL PASO COUNTY

## BIRDS

| | | Federal Status | State Status |
|---|---|---|---|
| **Northern Aplomado Falcon** | *Falco femoralis septentrionalis* | LE | E |

open country, especially savanna and open woodland, and sometimes in very barren areas; grassy plains and valleys with scattered mesquite, yucca, and cactus; nests in old stick nests of other bird species

| | | | |
|---|---|---|---|
| **Peregrine Falcon** | *Falco peregrinus* | DL | T |

both subspecies migrate across the state from more northern breeding areas in US and Canada to winter along coast and farther south; subspecies (F. p. anatum) is also a resident breeder in west Texas; the two subspecies' listing statuses differ, F.p. tundrius is no longer listed in Texas; but because the subspecies are not easily distinguishable at a distance, reference is generally made only to the species level; see subspecies for habitat.

**Prairie Falcon** *Falco mexicanus*

open, mountainous areas, plains and prairie; nests on cliffs

**Snowy Plover** *Charadrius alexandrinus*

formerly an uncommon breeder in the Panhandle; potential migrant; winter along coast

| | | | |
|---|---|---|---|
| **Southwestern Willow Flycatcher** | *Empidonax traillii extimus* | LE | E |

thickets of willow, cottonwood, mesquite, and other species along desert streams

| | | |
|---|---|---|
| **Sprague's Pipit** | *Anthus spragueii* | C |

only in Texas during migration and winter, mid September to early April; short to medium distance, diurnal migrant; strongly tied to native upland prairie, can be locally common in coastal grasslands, uncommon to rare further west; sensitive to patch size and avoids edges.

**Western Burrowing Owl** *Athene cunicularia hypugaea*

open grasslands, especially prairie, plains, and savanna, sometimes in open areas such as vacant lots near human habitation or airports; nests and roosts in abandoned burrows

**Western Snowy Plover** *Charadrius alexandrinus nivosus*

uncommon breeder in the Panhandle; potential migrant; winter along coast

| | | |
|---|---|---|
| **Western Yellow-billed Cuckoo** | *Coccyzus americanus occidentalis* | C;NL |

status applies only to western population beyond the Pecos River Drainage; breeds in riparian habitat and associated drainages; springs, developed wells, and earthen ponds supporting mesic vegetation; deciduous woodlands with cottonwoods and willows; dense understory foliage is important for nest site selection; nests in willow, mesquite, cottonwood, and hackberry; forages in similar riparian woodlands; breeding season mid-May-late Sept

## FISHES

| | | Federal Status | State Status |
|---|---|---|---|
| **Bluntnose shiner** | *Notropis simus simus* | | T |

extinct; Rio Grande; main river channel, often below obstructions over substrate of sand, gravel, and silt; damming and irrigation practices presumed major factors contributing to decline

# EL PASO COUNTY

## FISHES

| | | Federal Status | State Status |
|---|---|---|---|
| **Rio Grande silvery minnow** | *Hybognathus amarus* | LE | E |

extirpated; historically Rio Grande and Pecos River systems and canals; reintroduced in Big Bend area; pools and backwaters of medium to large streams with low or moderate gradient in mud, sand, or gravel bottom; ingests mud and bottom ooze for algae and other organic matter; probably spawns on silt substrates of quiet coves

## INSECTS

| | | Federal Status | State Status |
|---|---|---|---|
| **A Royal moth** | *Sphingicampa raspa* | | |

woodland - hardwood; with oaks, junipers, legumes and other woody trees and shrubs; good density of legume caterpillar foodplants must be present; Prairie acacia (Acacia augustissima) is the documented caterpillar foodplant, but there could be a few other woody legumes used

**A tiger beetle** *Cicindela hornii*

grassland/herbaceous; burrowing in or using soil; dry areas on hillside or mesas where soil is rocky or loamy and covered with grasses, invertivore; diurnal, hibernates/aestivates, active mostly for several days after heavy rains. the life cycle probably takes two years so larvae would always be present in burrows in the soil

**Barbara Ann's tiger beetle** *Cicindela politula barbarannae*

limestone outcrops in arid treeless environments or in openings within less arid pine-juniper-oak communities; open limestone substrate itself is almost certainly an essential feature; roads and trails

**Poling's hairstreak** *Fixsenia polingi*

oak woodland with Quercus grisea as substantial component, probably also uses Q. emoryi; larvae feed on new growth of Q. grisea, adults utilize nectar from a variety of flowers including milkweed and catslaw acacia; adults fly mid May - Jun, again mid Aug - early Sept

## MAMMALS

| | | Federal Status | State Status |
|---|---|---|---|
| **Big free-tailed bat** | *Nyctinomops macrotis* | | |

habitat data sparse but records indicate that species prefers to roost in crevices and cracks in high canyon walls, but will use buildings, as well; reproduction data sparse, gives birth to single offspring late June-early July; females gather in nursery colonies; winter habits undetermined, but may hibernate in the Trans-Pecos; opportunistic insectivore

| | | | |
|---|---|---|---|
| **Black bear** | *Ursus americanus* | T/SA;NL | T |

bottomland hardwoods and large tracts of inaccessible forested areas; due to field characteristics similar to Louisiana Black Bear (LT, T), treat all east Texas black bears as federal and state listed Threatened

| | | | |
|---|---|---|---|
| **Black-footed ferret** | *Mustela nigripes* | LE | |

extirpated; inhabited prairie dog towns in the general area

**Black-tailed prairie dog** *Cynomys ludovicianus*

dry, flat, short grasslands with low, relatively sparse vegetation, including areas overgrazed by cattle; live in large family groups

# EL PASO COUNTY

## MAMMALS

Federal Status State Status

**Cave myotis bat** *Myotis velifer*

colonial and cave-dwelling; also roosts in rock crevices, old buildings, carports, under bridges, and even in abandoned Cliff Swallow (Hirundo pyrrhonota) nests; roosts in clusters of up to thousands of individuals; hibernates in limestone caves of Edwards Plateau and gypsum cave of Panhandle during winter; opportunistic insectivore

**Desert pocket gopher** *Geomys arenarius*

cottonwood-willow association along the Rio Grande in El Paso and Hudspeth counties; live underground, but build large and conspicuous mounds; life history not well documented, but presumed to eat mostly vegetation, be active year round, and bear more than one litter per year

**Fringed bat** *Myotis thysanodes*

habitat variable, ranging from mountainous pine, oak, and pinyon-juniper to desert-scrub, but prefers grasslands at intermediate elevations; highly migratory species that arrives in Trans-Pecos by May to form nursery colonies; single offspring born June-July; roosts colonially in caves, mine tunnels, rock crevices, and old buildings

**Gray wolf** *Canis lupus* LE E

extirpated; formerly known throughout the western two-thirds of the state in forests, brushlands, or grasslands

**Long-legged bat** *Myotis volans*

in Texas, Trans-Pecos region; high, open woods and mountainous terrain; nursery colonies (which may contain several hundred individuals) form in summer in buildings, crevices, and hollow trees; apparently do not use caves as day roosts, but may use such sites at night; single offspring born June-July

**Pale Townsend's big-eared bat** *Corynorhinus townsendii pallescens*

roosts in caves, abandoned mine tunnels, and occasionally old buildings; hibernates in groups during winter; in summer months, males and females separate into solitary roosts and maternity colonies, respectively; single offspring born May-June; opportunistic insectivore

**Pecos River muskrat** *Ondatra zibethicus ripensis*

creeks, rivers, lakes, drainage ditches, and canals; prefer shallow, fresh water with clumps of marshy vegetation, such as cattails, bulrushes, and sedges; live in dome-shaped lodges constructed of vegetation; diet is mainly vegetation; breed year round

**Western red bat** *Lasiurus blossevillii*

roosts in tree foliage in riparian areas, also inhabits xeric thorn scrub and pine-oak forests; likely winter migrant to Mexico; multiple pups born mid-May - late Jun

**Western small-footed bat** *Myotis ciliolabrum*

mountainous regions of the Trans-Pecos, usually in wooded areas, also found in grassland and desert scrub habitats; roosts beneath slabs of rock, behind loose tree bark, and in buildings; maternity colonies often small and located in abandoned houses, barns, and other similar structures; apparently occurs in Texas only during spring and summer months; insectivorous

# EL PASO COUNTY

## MAMMALS

| | | Federal Status | State Status |
|---|---|---|---|
| **Yuma myotis bat** | *Myotis yumanensis* | | |

desert regions; most commonly found in lowland habitats near open water, where forages; roosts in caves, abandoned mine tunnels, and buildings; season of partus is May to early July; usually only one young born to each female

## MOLLUSKS

| | | Federal Status | State Status |
|---|---|---|---|
| **Franklin Mountain talus snail** | *Sonorella metcalfi* | | |

terrestrial; bare rock, talus, scree; inhabits igneous talus most commonly of rhyolitic origin

**Franklin Mountain wood snail** *Ashmunella pasonis*

terrestrial; bare rock, talus, scree; talus slopes, usually of limestone, but also of rhyolite, sandstone, and siltstone, in arid mountain ranges

## REPTILES

| | | Federal Status | State Status |
|---|---|---|---|
| **Big Bend slider** | *Trachemys gaigeae* | | |

almost exclusively aquatic, sliders (Trachemys spp.) prefer quiet bodies of fresh water with muddy bottoms and abundant aquatic vegetation, which is their main food source; will bask on logs, rocks or banks of water bodies; breeding March-July

| | | | |
|---|---|---|---|
| **Chihuahuan Desert lyre snake** | *Trimorphodon vilkinsonii* | | T |

mostly crevice-dwelling in predominantly limestone-surfaced desert northwest of the Rio Grande from Big Bend to the Franklin Mountains, especially in areas with jumbled boulders and rock faults/fissures; secretive; egg-bearing; eats mostly lizards

| | | | |
|---|---|---|---|
| **Mountain short-horned lizard** | *Phrynosoma hernandesi* | | T |

diurnal, usually in open, shrubby, or openly wooded areas with sparse vegetation at ground level; soil may vary from rocky to sandy; burrows into soil or occupies rodent burrow when inactive; eats ants, spiders, snails, sowbugs, and other invertebrates; inactive during cold weather; breeds March-September

**New Mexico garter snake** *Thamnophis sirtalis dorsalis*

nearly any type of wet or moist habitat; irrigation ditches, and riparian-corridor farmlands, less often in running water; home range about 2 acres; active year round in warm weather, both diurnal and nocturnal, more nocturnal during hot weather; bears litter July-August

| | | | |
|---|---|---|---|
| **Texas horned lizard** | *Phrynosoma cornutum* | | T |

open, arid and semi-arid regions with sparse vegetation, including grass, cactus, scattered brush or scrubby trees; soil may vary in texture from sandy to rocky; burrows into soil, enters rodent burrows, or hides under rock when inactive; breeds March-September

# EL PASO COUNTY

## PLANTS

Federal Status State Status

**Comal snakewood** *Colubrina stricta*

in El Paso County, found in a patch of thorny shrubs in colluvial deposits and sandy soils at the base of an igneous rock outcrop; the historic Comal County record does not describe the habitat; in Mexico ,found in shrublands on calcareous, gravelly, clay soils with woody associates; flowering late spring or early summer

**Desert night-blooming cereus** *Peniocereus greggii var greggii*

Chihuahuan Desert shrublands or shrub invaded grasslands in alluvial or gravelly soils at lower elevations, 1200-1500 m (3900-4900 ft), on slopes, benches, arroyos, flats, and washes; flowering synchronized over a few nights in early May to late June when almost all mature plants bloom, flowers last only one day and open just after dark, may flower as early as April

**Hueco rock-daisy** *Perityle huecoensis*

north-facing or otherwise mostly shaded limestone cliff faces within relatively mesic canyon system; flowering spring-fall

**Sand prickly-pear** *Opuntia arenaria*

deep, loose or semi-stabilized sands in sparsely vegetated dune or sandhill areas, or sandy floodplains in arroyos; flowering May-June

**Sand sacahuista** *Nolina arenicola*

Texas endemic; mesquite-sand sage shrublands on windblown Quarternary reddish sand in dune areas; flowering time uncertain May-June, June-September

**Sneed's pincushion cactus** *Escobaria sneedii var sneedii* LE E

xeric limestone outcrops on rocky, usually steep slopes in desert mountains, in the Chihuahuan Desert succulent shrublands or grasslands; flowering April-September (peak usually in April, sometimes opportunistically after summer rains; fruiting August - November

**Texas false saltgrass** *Allolepis texana*

sandy to silty soils of valley bottoms and river floodplains, not generally on alkaline or saline sites; flowering (May-) July-October depending on rainfall

**Wheeler's spurge** *Chamaesyce geyeri var wheeleriana*

sparingly vegetated, loose eolian quartz sand on reddish sand dunes or coppice mounds; flowering and fruiting at least August-September, probably earlier and later, as well

## Notes for
## County Lists of Texas' Special Species

The Texas Parks and Wildlife (TPWD) county lists **include**:

**Vertebrates, Invertebrates, and Vascular Plants** identified as being of conservation concern by TPWD within Texas. These special species lists are comprised of species, subspecies, and varieties that are federally listed; proposed to be federally listed; have federal candidate status; are state listed; or carry a global conservation status indicating a species is critically imperiled, very rare, vulnerable to extirpation, or uncommon.

The TPWD county lists **do not include**:

**Natural Plant Communities** such as Little Bluestem-Indiangrass Series (native prairie remnant), Water Oak-Willow Oak Series (bottomland hardwood community), Saltgrass-Cordgrass Series (salt or brackish marsh), Sphagnum-Beakrush Series (seepage bog).

**Other Significant Features** such as bird rookeries, migratory songbird fallout areas, comprehensive migratory bird information, bat roosts, bat caves, invertebrate caves, and prairie dog towns.

**These lists are not all inclusive for all rare species distributions.** The lists were compiled, developed, and are updated based on field guides, staff expertise, scientific publications, and the TPWD Texas Natural Diversity Database (TXNDD) (formerly the Biological and Conservation Data System) occurrence data. Historic ranges for some state extirpated species, full historic distributions for some extant species, accidentals and irregularly appearing species, and portions of migratory routes for particular species are not necessarily included. Species that appear on county lists do not all share the same probability of occurrence within a county. Some species are migrants or wintering residents only. Additionally, a few species may be historic or considered extirpated within a county.

TPWD includes the Federal listing status for your convenience and makes every attempt to keep the information current and correct. However, the US Fish and Wildlife Service (FWS) is the responsible authority for Federal listing status. The TPWD lists do not substitute for contact with the FWS and federally listed species county ranges may vary from the FWS county level species lists because of the inexact nature of range map development and use.

Status Key:

| | |
|---|---|
| LE, LT - | Federally Listed Endangered/Threatened |
| PE, PT - | Federally Proposed Endangered/Threatened |
| SAE, SAT - | Federally Listed Endangered/Threatened by Similarity of Appearance |
| C - | Federal Candidate for Listing; formerly Category 1 Candidate |
| DL, PDL - | Federally Delisted/Proposed for Delisting |
| NL - | Not Federally Listed |
| E, T - | State Listed Endangered/Threatened |
| NT - | Not tracked or no longer tracked by the State |
| "blank" - | Rare, but with no regulatory listing status |

This information is specifically for your assistance only; due to continuing data updates, **please do not redistribute the lists**, instead refer all requesters to the web site at: http://www.tpwd.state.tx.us/landwater/land/maps/gis/ris/endangered_species/ or to our office for the most current information available. Texas Parks and Wildlife Department
Wildlife Division Wildlife Habitat Assessment Program
4200 Smith School Road
Austin, Texas 78744

Subject: **Threatened and Endangered Species Assessment**
**McCombs Municipal Solid Waste Landfill, El Paso, Texas**

Dear Wildlife Division:

The McCombs Municipal Solid Waste Landfill (Landfill) located in El Paso, Texas (City) is proposing a vertical expansion of the existing Landfill footprint to provide additional capacity. The Landfill is located in El Paso County within the El Paso city limits and serves the waste needs of the City and the surrounding area. The Landfill is an existing Type 1 MSW disposal facility owned and operated by the City. The Landfill is located at the northeast corner of the intersection of McCombs Road and Stan Roberts Road (FM 2529) in El Paso, Texas. The address of the Landfill is 13660 McCombs Road.

The proposed vertical expansion will increase the height of the Landfill from the currently permitted elevation of 4,125 feet mean sea level (MSL) to 4,305 feet MSL. The existing permitted boundary of the Landfill is currently 327 acres (permitted in 1984), and is not proposed to increase. The primary use for this facility will remain dedicated for disposal of municipal solid waste.

A letter dated August 13, 1982 from the United States Fish and Wildlife Service (USFWS) has been included in Attachment 1. According to the USFWS letter, the American Peregrine Falcon may use the project site as a feeding area or pass through the area during migration. According to the information provided on the USFWS website, the American Peregrine Falcon was delisted from the federal endangered species list on August 25, 1999. However, the American Peregrine Falcon remains a State of Texas protected species.

As indicated in the USFWS letter, it is unlikely that the Landfill will have any effect on this species. However, if the American Peregrine Falcon were to be observed within the permitted Landfill area, the employees will be instructed to follow the steps listed below:

1. Avoid contact with the bird;
2. Temporarily halt or move site operations to an area away from the bird's location to prevent disrupting the bird's activities while feeding or passing by the site;

*SAIC Energy, Environment & Infrastructure, LLC*
*1380 Corporate Center Curve, Suite 305 | St. Paul, MN 55121 | tel: 651.994.8415 | fax: 651.994.8396 | saic.com/EEandI*

3. Wait until the bird abandons the site on its own will; and
4. Resume normal site operations once the bird has taken flight.

In addition, Landfill personnel will be trained regarding the bird's physical characteristics and appearance in order to be able to identify it at once and with certainty during operations. This training will prevent unnecessary and unwarranted disruptions of site activities due to the presence of birds that may look similar to the American Peregrine Falcon.

We are requesting information regarding any listed threatened or endangered species or their critical habitat within range of the project site. This information is required by Texas Administrative Code Chapter 330 (30 TAC §330.61 (n)).

If you have any questions or require additional information, please contact me at 651-994-8415 or fredric.j.doran@saic.com.

Sincerely,

**SAIC Energy, Environment & Infrastructure, LLC**

August 13, 1982

Rosemary Staley
Department of Planning,
Research and Development
#2 Civic Center Plaza - 5th Floor
El Paso, Texas 79999

Dear Ms. Staley:

By letter dated August 4, 1982, you provided the U.S. Fish and Wildlife Service (FWS) with maps showing the location of a proposed sanitary landfill at the intersection of McCombs Road and FM 2529 and requested information concerning endangered species. The proposed landfill would generally utilize an abandoned quarry adjacent to an existing landfill.

Federally listed endangered species present in El Paso County are the American peregrine falcon (Falco peregrinus anatum) and Sneed pincushion cactus (Coryphantha sneedii var. sneedii). It is unlikely that expanding the sanitary landfill would have any effect on the above listed species because the cactus is confined to the Franklin Mountains as is the nesting habitat of the peregrine falcon. The peregrine may use the project site as a feeding area or pass through the area during migration.

The letter describing the site contained insufficient information to assess the effect leaching from the landfill would have on ground water quality. The bottom of the abandoned quarry may need to be sealed to prevent contamination of ground water resources. If this is not a problem, the FWS believes that the proposed landfill site is a good location for expanding the City's waste disposal capability.

We appreciate the opportunity to review your project. If we may be of further assistance please, contact Don A. Meineke or me (Telephone 512/888-3346).

Sincerely yours,

ROGELIO PEREZ
Field Supervisor

## Part III

# Department of the Interior

**Fish and Wildlife Service**

**50 CFR Part 17**

**Endangered and Threatened Wildlife and Plants; Final Rule To Remove the American Peregrine Falcon From the Federal List of Endangered and Threatened Wildlife, and To Remove the Similarity of Appearance Provision for Free-Flying Peregrines in the Conterminous United States; Final Rule**

**DEPARTMENT OF THE INTERIOR**

**Fish and Wildlife Service**

**50 CFR Part 17**

**RIN 1018–AF04**

# Endangered and Threatened Wildlife and Plants; Final Rule To Remove the American Peregrine Falcon From the Federal List of Endangered and Threatened Wildlife, and To Remove the Similarity of Appearance Provision for Free-Flying Peregrines in the Conterminous United States

**AGENCY:** Fish and Wildlife Service, Interior.

**ACTION:** Final rule.

**SUMMARY:** We, the U.S. Fish and Wildlife Service (Service), have determined that the American peregrine falcon (*Falco peregrinus anatum*) is no longer an endangered or threatened species pursuant to the Endangered Species Act of 1973, as amended (Act). This determination is based on available data indicating that this subspecies has recovered following restrictions on organochlorine pesticides in the United States and Canada, and following the implementation of successful management activities. This action will remove the American peregrine falcon (*Falco peregrinus anatum*) throughout its range as an endangered species from the Federal List of Endangered and Threatened Wildlife, thereby removing all protections provided by the Act. It also will remove the designation of ''endangered due to similarity of appearance'' for any free-flying peregrine falcons within the 48 conterminous United States. It will not affect protection provided to this species by the Migratory Bird Treaty Act (MBTA), the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), or state laws and regulations, nor will it affect the endangered listing status of the Eurasian peregrine falcon (*Falco peregrinus peregrinus*) under the Act.

**EFFECTIVE DATE:** August 25, 1999.

**ADDRESSES:** The administrative file for this rule is available for inspection, by appointment, during normal business hours at the U.S. Fish and Wildlife Service, Ventura Fish and Wildlife Office, 2493 Portola Road, Suite B, Ventura, California 93003 (telephone (805) 644–1766/facsimile 805/644–3958).

**FOR FURTHER INFORMATION CONTACT:** Robert Mesta at the above address for further information on the removal of the peregrine falcon from the endangered species list.

**SUPPLEMENTARY INFORMATION:**

## Background

The peregrine falcon (*Falco peregrinus*) is a medium-sized raptor weighing approximately 1,000 grams (36 ounces) and having a wing span of 112 centimeters (44 inches). The adult peregrine falcon has a dark gray back and crown, dark bars or streaks on a pale chest and abdomen, and heavy malar (cheek) stripes on the face. Immature falcons are buff-colored in front and have dark brown backs; adults are white or buff in front and bluish-gray on their backs. Peregrines prey almost entirely on other birds, and occasionally on bats, caught in midair (Hickey and Anderson 1969).

The peregrine falcon has an almost worldwide distribution, with three subspecies recognized in North America (Brown and Amadon 1968). The Peale's falcon (*F. p. pealei*) is a year-round resident of the northwest Pacific coast from northern Washington through British Columbia to the Aleutian Islands. The Arctic peregrine falcon (*F. p. tundrius*) nests in the tundra of Alaska, Canada, and Greenland, and is typically a long-distance migrant, wintering as far south as South America. The American peregrine falcon (*F. p. anatum*) occurs throughout much of North America from the subarctic boreal forests of Alaska and Canada south to Mexico. The American peregrine falcon nests from central Alaska, central Yukon Territory, and northern Alberta and Saskatchewan, east to the Maritimes and south (excluding coastal areas north of the Columbia River in Washington and British Columbia) throughout western Canada and the United States to Baja California, Sonora, and the highlands of central Mexico (48 FR 8799). American peregrine falcons that nest in subarctic areas generally winter in South America, while those that nest at lower latitudes exhibit variable migratory behavior; some are nonmigratory (Yates *et al.* 1988).

Since the early 1970s, efforts to reestablish peregrine falcons in the eastern and midwestern United States have successfully returned this species to areas from which it was extirpated (See ''Eastern United States'' under ''Peregrine Falcon Recovery''). Peregrine falcons are now found nesting in all States within their historical range east of the 100th meridian, except for Rhode Island, West Virginia, and Arkansas.

Peregrine falcons declined precipitously in North America following World War II (Kiff 1988). Research implicated organochlorine pesticides, mainly 1,1,1-trichloro-2,2-bis(p-chlorophenyl)-ethane (DDT), applied in the United States and Canada during this same period, as causing the decline (for a review, see Risebrough and Peakall 1988). Use of these chemicals peaked in the 1950s and early 1960s and continued through the early 1970s. Organochlorines and their metabolites, including DDT and its principal metabolite DDE (1,1-dichloro-2,2-bis(*p*-chlorophenyl)-ethylene), aldrin, dieldrin, and others, are stable, persistent compounds that are stored in the fatty tissues of animals ingesting contaminated food (Fyfe *et al.* 1988).

Organochlorines can affect peregrine falcons either by causing direct mortality or by adversely affecting reproduction. Because mortality in wild birds is difficult to study, the effect of organochlorines on mortality is not as well known as the effects on reproduction. Organochlorines can adversely affect reproduction by causing egg breakage, addling, hatching failure, and abnormal reproductive behavior by the parent birds (Risebrough and Peakall 1988). DDE prevents normal calcium deposition during eggshell formation, resulting in thin-shelled eggs that are susceptible to breakage during incubation. In general, populations laying eggs with shells that averaged more than 17 percent thinner than pre-DDT eggs had such high rates of reproductive failure that the number of peregrine falcon pairs declined (Peakall and Kiff 1988).

During the period of DDT use in North America, eggshell thinning and nesting failures were widespread in peregrine falcons, and in some areas, successful reproduction virtually ceased (Hickey and Anderson 1969). As a result, there was a slow but drastic decline in the number of peregrine falcons in many areas of North America. The degree of exposure to these pesticides varied among regions, and peregrine falcon numbers in more contaminated areas suffered greater declines. Peregrine falcons that nested outside of agricultural and forested areas where DDT was heavily used were affected less, although some of these individuals were still exposed to DDT when wintering in areas of pesticide use. Presumably all peregrine falcon individuals have eaten some migratory prey containing organochlorines (for reviews, see Hickey and Anderson 1969; Kiff 1988; Peakall and Kiff 1988).

Peregrine falcons nesting in the agricultural and forested areas east of the Mississippi River in the United States and in eastern Canada south of the boreal forest were the most heavily contaminated and were essentially

extirpated by the mid-1960s (Berger *et al.* 1969). Peregrine falcons in the Great Plains states east of the Rocky Mountains and south of the boreal forest in Canada and the United States were also extirpated in the DDT-era (Cade 1975; Enderson *et al.* 1995). No active eyries (nests) were found in surveys of 133 formerly used peregrine falcon eyries in the latter part of the 1964 nesting season in the eastern United States and the Maritime Provinces in Canada (Berger *et al.* 1969). By 1975, there were only three peregrine falcon pairs in Alberta, and no other peregrine falcon pairs were found south of latitude 60 degrees North and east of the Rocky Mountains in Canada (Erickson *et al.* 1988).

West of the 100th meridian, peregrine falcons were significantly reduced; only 33 percent of historical nest sites in the Rocky Mountains were still occupied by 1965 (Enderson 1969). The peregrine falcon disappeared as a breeding species from southern California, and major declines also occurred in other parts of the western United States and in much of southern Canada and the Northwest Territories (Kiff 1988). In contrast, peregrine falcons in most areas of the Pacific coast of Alaska remained fairly stable during this period, due to their lower exposure to organochlorine pesticides. The exact degree of local declines in much of western North America remains somewhat speculative due to a lack of accurate pre-pesticide era census data. For example, in the southwestern United States and mainland Mexico, peregrine falcons were not censused until after the beginning of the use of organochlorines (Kiff 1988).

**Previous Federal Actions**

Population declines due to negative impacts of DDT and its metabolites on peregrine falcon reproduction and survival led us to list two of the three North American subspecies, the Arctic peregrine falcon and the American peregrine falcon, as endangered in 1970 under the Endangered Species Conservation Act of 1969 (Public Law 91–135, 83 Stat. 275). Arctic and American peregrine falcons were included in the United States' list of endangered foreign species on June 2, 1970 (35 FR 8491) under the Endangered Species Conservation Act of 1969, and the native list of endangered species on October 13, 1970 (35 FR 16047). Upon passage of the Endangered Species Act of 1973, as amended (Act) (16 U.S.C. 1531 *et seq.*), the native and foreign species lists were combined into a single list of endangered and threatened species. Both the American and Arctic peregrine falcon subspecies were listed as endangered throughout their respective ranges. The Peale's peregrine falcon was not listed because it was reproducing at near normal levels with only traces of DDT.

On March 1, 1983, we published a proposed rule to (1) reclassify the Arctic peregrine falcon from endangered to threatened; (2) clarify the status of the American peregrine falcon (*Falco peregrinus anatum*) in some areas of its range; and (3) designate all free-flying peregrine falcons in the 48 conterminous United States as endangered under the similarity of appearance provisions of section 4(e) of the Act (48 FR 8796). A final rule was published on March 20, 1984 (49 FR 10520). Pursuant to the similarity of appearance provisions, species that are not considered to be endangered or threatened are treated as such for the purpose of providing protection to a species that is biologically endangered or threatened.

On June 12, 1991, we announced in the **Federal Register** a Notice of Status Review of American and Arctic peregrines (56 FR 26969). The Arctic peregrine was removed as a threatened species from the Federal List of Endangered and Threatened Wildlife on October 5, 1994 (59 FR 50796) but was still regulated under the Act in the lower 48 United States due to the similarity of appearance provision for all *Falco peregrinus* peregrine falcons. The similarity of appearance provision was maintained because the American peregrine falcon was still listed as endangered.

We published an Advanced Notice of a Proposal to Remove the American Peregrine Falcon from the Federal List of Endangered and Threatened Wildlife on June 30, 1995 (60 FR 34406). This was based on data indicating this subspecies was recovered following restrictions on the use of organochlorine pesticides in the United States and Canada and because of successful management activities, including the reintroduction of captive-bred and relocated wild hatchling peregrine falcons. Current data provides additional support for recovery of all North American peregrine falcons, including the American peregrine falcon subspecies. We published a proposed rule to remove the peregrine falcon in North America from the Federal List of Endangered and Threatened Wildlife on August 26, 1998, based on continuing data indicating this species was recovered (63 FR 45446).

The processing of this final rule conforms with our listing priority guidance published on May 8, 1998 (63 FR 25502). This guidance clarifies the order in which we will process rulemakings, giving highest priority to handling emergency situations (Tier 1) and second highest priority (Tier 2) to resolving the listing status of outstanding proposed listings, resolving the conservation status of candidate species, processing administrative findings on petitions to add species to the lists or reclassify species from threatened to endangered status, and delisting or reclassifying actions. The lowest priority actions, processing critical habitat designations, are in Tier 3. Processing of this final rule is a Tier 2 action.

**Peregrine Falcon Recovery**

Section 4(f) of the Act directs us to develop and implement recovery plans for listed species. In some cases, we appoint experts to recovery teams to assist in the writing of recovery plans. Between 1974 and 1975 we formed recovery teams consisting of Service, State, and other experts. In cooperation with us, these recovery teams produced four regional recovery plans: three for the American peregrine falcon (Alaska, Rocky Mountains/Southwest United States, and the Pacific Coast of the United States), and one for the peregrine falcon in the eastern United States. Although no United States recovery plans established recovery criteria for peregrine falcons nesting outside of the United States, the Canadian Wildlife Service published an *Anatum* Peregrine Falcon Recovery Plan (Erickson *et al.* 1988) establishing recovery criteria for American peregrine falcons in Canada. Recovery plans for peregrine falcons called for captive rearing and release of birds in several areas of North America. In the eastern United States, where peregrine falcons were extirpated, the initial recovery objective was to reestablish peregrine falcons through the release of offspring from a variety of wild stocks being held in captivity by falconers. The first experimental releases of captive-produced young occurred in 1974 and 1975 in the United States. Since then, approximately 6,000 falcons were released throughout its historic range in North America. These releases helped to re-establish breeding pairs in areas where the species was extirpated, and accelerated the recovery of the species.

Later, reintroduction was also pursued in eastern Canada using only *F. p. anatum* breeding stock from the boreal regions of the subspecies' range. All peregrine falcons released to augment wild populations in western North America west of the 100th meridian, where small numbers of

American peregrines survived the pesticide era, were derived from western *anatum* stock (Enderson *et al.* 1995).

The most significant factor in the recovery of the peregrine falcon was the restriction placed on the use of organochlorine pesticides. Use of DDT was banned in Canada in 1970 and in the United States in 1972 (37 FR 13369). Restrictions that controlled the use of aldrin and dieldrin were imposed in the United States in 1974 (39 FR 37246). Since implementation of these restrictions, residues of the pesticides have significantly decreased in many regions where they were formerly used. Consequently, reproductive rates in most surviving peregrine falcon populations in North America improved, and numbers began to increase (Kiff 1988; Enderson *et al.* 1995).

In Alaska and northwest Canada, American peregrine falcon populations were locally depressed, but enough individuals survived the pesticide era to allow populations to expand without the need for release of captive-bred falcons. Likewise, in the southwestern United States, very few captive-bred birds were released, and populations recovered naturally following restrictions on the use of organochlorine pesticides. In southwest Canada, the northern Rocky Mountain States, and the Pacific Coast States, however, local populations were greatly depressed or extirpated, and over 3,400 young American peregrine falcons were released to promote recovery in those areas (Enderson *et al.* 1995).

American peregrine falcon population growth was noted in Alaska in the late 1970s (Ambrose *et al.* 1988b), and, by 1980, population growth was found in many other areas (Enderson *et al.* 1995). The rate of increase varied among regions of North America, undoubtedly influenced by variation in patterns of pesticide use, potential differences in the rate of pesticide degradation, and the degree to which local populations had declined. Populations in some portions of the range of American peregrine falcons, such as Alaska, northwest Canada, and southwestern United States, reached densities several years ago that suggested recovery was approaching completion (Ambrose *et al.* 1988b; Mossop 1988; Geoff Holroyd, Canadian Wildlife Service, *in litt.* 1993; Enderson *et al.* 1995). Residual organochlorine pesticide contamination continues to affect eggshells in some areas, such as portions of coastal California (Jarman 1994) and western Texas (Bonnie McKinney, Texas Parks and Wildlife Department, pers. comm. 1997), but these effects are localized. Despite these localized effects and the variation in the rate of increase among regions, local populations throughout North America have increased in size, and positive trends in nearly all areas suggest that an extensive recovery of American peregrine falcons has taken place.

**Recovery Status**

To aid in assessing peregrine falcon recovery, the current status was compared to specific recovery plan objectives for American peregrine falcons in (1) Alaska, (2) Canada, (3) the Pacific Coast, (4) the Rocky Mountains and the Southwest, and for the peregrine falcon in, and (5) the eastern United States. The current status of the subspecies in Mexico is discussed below, although no recovery plan or recovery objectives are established for Mexico.

*Alaska*

The Peregrine Falcon Recovery Plan, Alaska Population (Alaska Recovery Plan) (U.S. Fish and Wildlife Service 1982a) includes both Arctic and American peregrine falcons nesting in Alaska. The following discussion relates only to provisions regarding the American peregrine falcon, as the Arctic peregrine falcon was delisted on October 5, 1994 (59 FR 50796).

The Alaska Recovery Plan established recovery objectives based on four measurements for assessing the status of American peregrine falcons including population size, reproductive performance, pesticide residues in eggs, and eggshell thickness. The recovery objectives included:

(1) 28 nesting pairs in 2 specified study areas (16 in upper Yukon and 12 in upper Tanana);

(2) An average of 1.8 young per territorial pair;

(3) Average organochlorine concentration in eggs of less than 5 parts per million (ppm) (wet weight basis DDE); and

(4) Eggshells no more than 10 percent thinner than pre-DDT era eggshells.

The Alaska Recovery Plan suggested that these objectives be maintained in the specified study areas for 5 years before reclassifying from endangered to threatened status, and remain constant or improve for an additional 5 years before delisting.

Surveys were conducted in the upper Yukon and Tanana Rivers, for which historical population data were available, using consistent methodology from 1973 to the present so trends would be discernable. Surveys conducted between 1966 and 1998 along the upper Yukon River demonstrated increases in the number of occupied nesting territories from a low of 11 known pairs in 1973 to 46 pairs in 1998 (Ambrose *et al.* 1988b; Robert Ambrose, U.S. Fish and Wildlife Service, *in litt.* 1997a, 1999). Similarly, along the upper Tanana River, the number of occupied nesting territories increased from 2 in 1975 to 33 in 1998 (R. Ambrose, *in litt.* 1997a; 1999). The recovery objective of 28 occupied nesting territories in the two study areas was first achieved (post-DDT) in 1988, with 23 nesting territories on the Yukon River and 12 on the Tanana River. The number has increased steadily since that time to the current level of 79 occupied nesting territories in 1998, with 46 pairs on the Yukon River and 33 pairs on the Tanana River (R. Ambrose, *in litt.* 1999). Thus, the recovery objective of 28 occupied nesting territories was achieved and surpassed for 10 years. A minimum of 301 breeding pairs of American peregrine falcons currently nest in Alaska.

Productivity measured along the upper Yukon and Tanana Rivers fell to a low of about 1.0 young per territorial pair per year (yg/pr) in the late 1960s, but began to increase in the mid-1970s. By 1982, productivity exceeded the objective of 1.8 yg/pr, and varied between 1.6 and 3.0 yg/pr in the years since. Between 1994 and 1998, productivity averaged 2.0 yg/pr (sample size (N) = 362 nests/pairs). Overall, between 1982 and 1998, the Yukon River study area averaged 1.79 yg/pr, and the Tanana River study area averaged 1.85 yg/pr (R. Ambrose, *in litt.* 1999). It is expected that there are yearly variations in productivity, which most wildlife species experience. However, average productivity for the peregrine falcon was constant or improving, thus meeting the goal of at least 1.8 yg/pr over the last 10 years as recommended by the Alaska Recovery Plan.

Mean concentrations of DDE in peregrine falcon eggs in excess of 15–20 ppm are associated with nesting failure, whereas productivity is usually sufficient to maintain population size if residues average less than this concentration (Peakall *et al.* 1975, as cited in Peakall and Kiff 1988; Newton *et al.* 1989). In Alaska, average DDE residues in American peregrine falcons averaged 12.2 ppm from 1979 through 1984, 5.8 ppm from 1988 through 1991, and 3.5 ppm from 1993 through 1995 (R. Ambrose, *in litt.* 1997b). Current data suggest that the concentrations of less than 5 ppm DDE residue levels in peregrine falcon eggs have improved in the last 10 years (R. Ambrose *in litt.* 1997b). As a result of lowered DDE

concentrations, there was consistent population growth during that time.

In Alaska, eggshells were as much as 20–22 percent thinner than pre-DDT era shells in the mid-1960s (Cade *et al.* 1988). By the early 1980s, shells were about 14 percent thinner than before the DDT era (Ambrose *et al.* 1988a). Eggshells averaged 13.0 percent thinner from 1979 through 1984, 13.1 percent thinner from 1988 through 1991, and 12.1 percent thinner from 1993 through 1995 (R. Ambrose, *in litt.* 1997b). The average thickness of pre-DDT American peregrine falcon eggs from Alaska is not precisely known, so current estimates of thinning could be inaccurate. While average eggshell thinning has not yet reached the level of 10 percent or less of the pre-DDT era, it has improved over the last 10 years. Also, reproduction was sufficient to allow consistent population growth since the late 1970s, and productivity has, on average, exceeded its stated recovery objective for 17 years.

In summary, based on the most current information (1998 survey and early 1990s contamination data), we conclude that goals underlying all four objectives were met or exceeded. On average, the number of pairs occupying nesting territories in the two study areas and productivity exceeded the recovery objectives for the past 17 years. Neither DDE residues in eggs nor eggshell thinning has prevented a dramatic population growth since the late 1970s.

*Canada*

The 1988 *Anatum* Peregrine Falcon Recovery Plan for Canada (Canadian Recovery Plan) (Erickson *et al.* 1988) categorized the historical range of the American peregrine falcon throughout Canada into three regions, which include the Western Mountains, Interior Plains, and the Eastern Seaboard and Great Lakes. These regions were subdivided into nine zones on the basis of historical population levels, habitat, political boundaries, and restoration needs. The zones are (1) Maritime, (2) Great Lakes, (3) Prairies, (4) Mackenzie River Valley, (5) Northern Mountains, (6) Southern Mountains, (7) Eastern Mackenzie Watershed, (8) Western Canadian Shield, and the (9) Eastern Canadian Shield. Coastal British Columbia was excluded from consideration in the Canadian Recovery Plan because that area is occupied by *F.p. pealei.*

The goal of the Canadian Recovery Plan was to increase the wild American peregrine falcon population in Canada so the subspecies is no longer considered endangered or threatened by the Committee on the Status of Endangered Wildlife in Canada. The proposed objectives were (1) to establish by 1992 a minimum of 10 territorial American peregrine falcon pairs in each of Zones 1 to 6, and (2) to establish by 1997, in each of 5 of these 6 zones, a minimum of 10 pairs naturally fledging 15 (1.5 yg/pr) or more young annually, measured as a 5-year average beginning in 1993. No recovery objectives were established for Zones 7, 8, and 9. The Canadian Recovery Plan did not contain separate objectives for reclassification of the subspecies in Canada from its current endangered status to threatened.

Starting in 1990, the Canadian Wildlife Service has coordinated and published a national range-wide peregrine falcon population survey once every 5 years. The results of the 1995 national population survey were used in the following status summary of the American peregrine falcon in Canada (Ursula Banasch, Canadian Wildlife Service, *in litt.* 1997).

There were 98 known nest sites in Zones 1 and 2 (southern Ontario and Quebec, northern Great Lakes, Bay of Fundy and Labrador), and surveys located 64 pairs. There were 98 known nest sites in Zone 3 (Manitoba, Saskatchewan and Alberta), and surveys located 41 pairs. There were 117 known nest sites in Zone 4 (eastern N.W. Territories), and surveys located 83 pairs. There were 125 known nest sites in Zone 5 (Yukon), and surveys located 113 pairs. There were 50 known nest sites in Zone 6 (Interior British Columbia), and surveys located 18 pairs. The total known number of pairs for all six zones in 1995 was 319, with minimum objectives achieved for every recovery zone.

The only comprehensive range-wide productivity surveys available to us were the national population surveys coordinated by the Canadian Wildlife Service in 1990 and 1995 (U. Banasch, *in litt.* 1997; Holroyd and Banasch 1996). Surveys conducted in the intervening years were not nationally coordinated, and therefore not complete. Thus, we used the combined average annual productivity data collected in the 1990 and 1995 surveys to address this recovery objective.

In Zones 1 and 2, average productivity was 1.7 yg/pr (N=104 nests). In Zone 3, average productivity was 1.5 yg/pr (N=55). In Zone 4, average productivity was 2.0 yg/pr (N=171). In Zone 5, average productivity was 1.8 yg/pr (N=626). No productivity data were available for Zone 6. The 2-year average annual productivity for the Canadian population of American peregrine falcons was 1.8 yg/pr.

Although the Canadian Recovery Plan did not identify recovery objectives for pesticide residue or eggshell thinning levels, 205 eggs and 62 samples from 28 specimens of peregrine falcons were collected in Canada between 1965 and 1987 to assess organochlorine residue concentrations. In all three subspecies (*F.p. anatum, F.p. tundrius, F.p. pealei*), the proportion of specimens having residue concentrations above established critical values (concentration at which egg failure occurs, which varies among organochlorine contaminants) had decreased and was inversely correlated with improvements in the reproductive success of the population (Peakall *et al.* 1990).

In summary, the Canadian Recovery Plan identified two objectives to determine recovery for the American peregrine falcon population in Canada. Based on current available information, both objectives were met. The total number of pairs for all six zones in 1995 was 319, with minimum objectives achieved for every recovery zone. This count exceeds the total recovery objective of 60 pairs by 259 pairs. The average annual productivity data for 1990 and 1995 either met or exceeded objectives in five of the six zones with an average annual productivity of 1.8 yg/pr for the American peregrine falcon population in Canada.

*Pacific Coast*

To reclassify the American peregrine falcon from endangered to threatened, the Pacific Coast Recovery Plan (Pacific Population Plan) (U.S. Fish and Wildlife Service 1982b) recommended that 122 pairs be established in a specified distribution spanning California, Washington, Oregon, and Nevada. The distribution goals were based on 22 management units distributed throughout the historic range of the Pacific Coast peregrine falcon population. For each management unit, the population must achieve a specified minimum number of active pairs before downlisting can be considered. The Pacific Population Plan also recommended that with attainment of 185 wild, self-sustaining pairs (California 120, Oregon 30, Washington 30, and Nevada 5 pairs) and an average productivity of 1.5 yg/pr for a 5-year period, the subspecies could be considered for delisting. Since this final rule addresses the delisting of the peregrine falcon, only the latter two objectives are discussed in this section. The Pacific Population Plan defined a ''self-sustaining'' population as one whose natural productivity without human management is equal to or greater than its mortality.

By 1976, no American peregrine falcons were found at 14 historical nest sites in Washington, and Oregon had also lost most of its peregrine falcons. In addition, only 1 or 2 pairs remained on the California coast, with no more than 10 nest sites known to be occupied in the entire State (Cade 1994). A steadily increasing number of American peregrine falcon pairs breeding in Washington, Oregon, and Nevada was indicated by surveys from 1991 through 1998. Known pairs in Washington increased from 17 to 45, in Oregon from 23 to 51, and in Nevada from 3 to 6 (Gary Herron, Nevada Division of Wildlife, pers. comm. 1997; Martin Nugent, Oregon Department of Fish and Wildlife, *in litt.* 1999; David Anderson, Washington Department of Fish and Game, *in litt.* 1997). The number of American peregrine falcons in California increased from an estimated low of 5 to 10 breeding pairs in the early 1970s (Herman 1971), to a minimum of 167 occupied sites in 1998 (Janet Linthicum, Santa Cruz Predatory Bird Research Group, *in litt.* 1999). The increase in California was concurrent with the restriction of DDT and management that included the release of over 750 American peregrine falcons, including captive-reared and relocated wild hatchlings, through 1997 (Walton 1997). Recovery of American peregrine falcons in some areas of California, however, was impeded by continuing elevated DDT levels (Jarman 1994; Walton 1997).

The recovery of the peregrine falcon could be the result of a lower than expected first-year mortality of released birds from the augmentation program, which accelerated the growth of the Pacific population (Brian Walton, Santa Cruz Predatory Bird Research Group, pers. comm. 1997). As a result, intensive human management has essentially ended, and the release of captive-bred American peregrine falcons was suspended in Nevada in 1989, in California in 1992 (although the relocation of wild hatchlings continues), and in Oregon and Washington in 1995. Based on available information, the first recovery objective was met; a minimum known population of 270 pairs exceeds the delisting goal of 185 by 85 pairs. Also, the distribution goals for the Pacific Coast population was met in all four States. Surveys conducted from 1991 through 1998 demonstrate a steadily increasing number of American peregrine falcon pairs, indicating that natural productivity is greater than mortality in this recovery region.

Productivity measured in Washington between 1993 and 1998 ranged from 1.3 to 1.8 yg/pr, with an average of 1.5 yg/pr (N=204) (D. Anderson, *in litt.* 1999). In Oregon, productivity between 1993 and 1998 ranged from 0.8 to 1.9 yg/pr, with an average of 1.3 yg/pr (N=178) (M. Nugent, *in litt.* 1997; David Peterson, U.S. Fish and Wildlife Service, *in litt.* 1999). Between 1993 and 1998, productivity in California ranged from 1.4 to 1.7 yg/pr (N=523), with an average of 1.6 yg/pr (J. Linthicum *in litt.* 1999). No productivity data were available for Nevada.

Productivity, an important measure of population health, can be difficult to determine in wide-ranging species nesting in remote landscapes that are often difficult to access. However, available data indicate that the average productivity from 1993 through 1998 in Washington, Oregon and California was 1.5 yg/pr (D. Anderson, *in litt.* 1999; M. Nugent, *in litt.* 1997; David Peterson, U.S. Fish and Wildlife Service, *in litt.* 1999; J. Linthicum *in litt.* 1999). Therefore, we consider this objective to be met.

The Pacific Population Plan did not identify recovery objectives for pesticide residue or eggshell thinning levels. However, organochlorine residues and eggshell thinning were measured in California starting in the early 1970s. Jarman (1994) reported DDE concentrations in 105 peregrine eggs collected from California from 1987 to 1992, and 11 eggs from Oregon from 1990 through 1993. Data collected in nine study regions in California (Jarman 1994) indicated the highest concentrations of DDE were found in California eggs from the Channel Islands and mid-coast with 21 and 13 ppm, respectively. The southern coast and San Francisco regions had the lowest concentrations of 5.5 and 4.3 ppm, respectively. The DDE concentrations in eggs collected along the coast of California (between San Francisco Bay and 34° N) did not decrease between 1969 and 1992 (Jarman 1994). Eggs from Oregon contained DDE levels of 10 ppm.

Eggshells from coastal California continued to show thinning. In northern and central coastal California, eggshells collected between 1975 and 1995 averaged 17.7 and 19.1 percent thinner than pre-DDT era, respectively (J. Linthicum, *in litt.* 1996). In northern interior California, where 104 of the 186 sites were active at least once from 1975–1993, eggshells averaged 15.6 percent thinner than pre-DDT era shells (J. Linthicum, *in litt.* 1996). Eggshells collected on the Channel Islands off the southern coast of California in 1992–1995 averaged 19.4 percent thinner than those collected in California prior to 1947 (J. Linthicum, *in litt.* 1996). In montane California, the average was 15 percent thinner than normal, and in the southern interior (coastal mountains) the average was 17.9 percent thinner than normal (J. Linthicum, *in litt.* 1996). Urban pairs experienced eggshell thinning averaging 8.7 percent in the San Francisco area and 10.9 percent in the Los Angeles/Orange County area. A summary of 633 clutch mean measurements representing 1,237 samples of one or more eggshells collected between 1975 and 1995 from the historical range of the American peregrine falcon in California averaged 16.1 percent thinner (J. Linthicum, *in litt.* 1996). However, current reproduction indicates an expanding population in most areas despite high organochlorine residue concentrations and associated eggshell thinning in some areas of the Pacific population.

*Rocky Mountain/Southwest*

The American Peregrine Falcon Rocky Mountain/Southwest Population Recovery Plan (U.S. Fish and Wildlife Service 1984) established three objectives for delisting, including (1) increasing the *Falco peregrinus anatum* population in the Rocky Mountain/Southwest region to a minimum of 183 breeding pairs and the following distribution: Arizona (46), Colorado (31), Idaho (17), Montana (20), Nebraska (1), New Mexico (23), North Dakota (1), South Dakota (1), Texas (8), Utah (21), and Wyoming (14); (2) sustaining a long-term average production of 1.25 yg/pr without manipulation by 1995; and (3) observing eggshell thinning of no more than 10 percent from the pre-DDT era for a 5-year span.

The prairie States of North Dakota, South Dakota, Nebraska, Kansas, and Oklahoma contain little peregrine falcon habitat, and historical data are incomplete. No recovery goals for a specific number of peregrine falcon pairs were set for Kansas or Oklahoma; nesting peregrine falcons are not known from Oklahoma. Currently, South Dakota, Nebraska and Kansas each have one peregrine falcon pair (Mark Martell, The Raptor Center, pers. comm. 1998; Tordoff *et al.* 1997); no peregrine falcon pairs are currently known to occur in North Dakota or Oklahoma.

The Rocky Mountain/Southwest population of the American peregrine falcon has made a profound comeback since the late 1970s when surveys showed no occupied nest sites in Idaho, Montana, or Wyoming and few pairs in Colorado, New Mexico, and the Colorado Plateau, including parts of southern Utah and Arizona (Cade 1994). Surveys conducted from 1991 through 1998 indicated that the number of American peregrine falcon pairs in the

Rocky Mountain/Southwest population is steadily increasing. In 1991, this population supported 367 known pairs; in 1998 the number of pairs increased to 535 (Robert Mesta, U.S. Fish and Wildlife Service, *in litt.* 1999). Surveys conducted from 1992 through 1998 showed that, with the exception of North Dakota, all States within the Rocky Mountain/Southwest population have met or exceeded their specific delisting goals for breeding pairs.

The current minimum known number of peregrine falcon pairs for each State include Arizona 159, Colorado 89, Idaho 17, Montana 18, Nebraska 1, New Mexico 32, North Dakota 0, South Dakota 1, Texas 11, Utah 164, Wyoming 42, and Kansas 1 (Greg Beatty, Arizona Game and Fish Department, *in litt.* 1997; James Enderson, Western Peregrine Falcon Recovery Team, pers. comm. 1999; Dennis Flath, Montana Department of Fish and Parks, *in litt.* 1999; Frank Howe, Utah Division of Wildlife Resources, *in litt.* 1999; Levine *et al.* 1998; McKinney 1994; B. McKinney, pers. comm. 1999; Robert Oakleaf, Wyoming Game and Fish Department, *in litt.* 1999; Sator O. Williams III, New Mexico Department of Game and Fish, *in litt.* 1999). The current Rocky Mountain/Southwest population is 535, which surpasses the objective of 183 by 352 pairs.

In Arizona , productivity from 1989 through 1997 ranged from 0.9 to 1.8 yg/yr, with an average productivity of 1.1 yg/pr (N=294). Recent average productivity (1994–1997) is 0.9 yg/pr (N=194) (Ward and Siemens 1995; G. Beatty, *in litt.* 1997).

In 1973, 1974, and 1975, productivity in Colorado was 0.2 (N=11), 1.9 (N=8), and 0.7 yg/pr (N=8), respectively, reflecting the irregular and generally poor productivity typical of the 1970s (Platt and Enderson 1988). Long term productivity measured in Colorado from 1985 through 1998 ranged from 1.2 to 1.9 yg/pr, with an average of 1.6 yg/pr (N=753) (Gerry Craig, Colorado Division of Wildlife, *in litt.* 1999; J.H. Enderson, pers. comm. 1999). Recent productivity from 1994 through 1998, averaged 1.6 yg/pr (N=395) (G. Craig, *in litt.* 1999).

In Idaho, productivity recorded from 1989 through 1998 ranged from 0 to 2.5 yg/pr, with an average of 1.6 yg/pr for this 10-year period (N=120). Recent productivity from 1994 through 1998 averaged 1.4 yg/pr (N=75) (Levine *et al.* 1998). In Montana, productivity between 1984 and 1998 ranged from 0.3 to 3.0 yg/pr, with an average of 1.7 yg/pr for the 15-year period (N=137). Recent productivity from 1994 through 1998 averaged 1.5 yg/pr (N=91) (D. Flath, *in litt.* 1999). In Nebraska, productivity between 1992 and 1998 for a single pair ranged from 0 to 5.0 yg/pr, with an average of 1.7 yg/pr for the 7-year period (N=7) (Lloyd Kiff, The Peregrine Fund, *in litt.* 1997; Tordoff *et al.* 1998).

For the period 1986 through 1998, New Mexico experienced a 12-year average productivity of 1.6 yg/pr (N=278). Recent productivity from 1995 through 1998 averaged 1.4 yg/pr (N=131) (S. Williams, *in litt.* 1997, 1999). In Texas, long term productivity recorded from 1975 through 1998 ranged from 0 to 2.3 yg/pr, with an average of 0.9 yg/pr (N=185) for the 23-year period. Recent productivity from 1994 through 1998 averaged 0.5 yg/pr (N=69) (McKinney 1994; B. McKinney, pers. comm. 1999).

In Utah, between 1985 and 1987, productivity averaged 0.8 yg/pr (N=117). From 1991 through 1996, productivity ranged from 0.9 to 2.0 yg/pr, with an average of 1.3 yg/pr (N=629) for the 6-year period (Bunnell 1994; F. Howe, *in litt.* 1997). In Wyoming, productivity between 1984 and 1998 ranged from 0.9 to 3.0 yg/pr, with an average of 1.7 yg/pr (N=282) for the 15-year period. Recent productivity between 1994 and 1998 averaged 1.8 yg/pr (N=179) (Joe White, Wyoming Game and Fish Department, *in litt.* 1995; R. Oakleaf, *in litt.* 1999).

In Kansas, productivity between 1993 and 1998 ranged from 0 to 3.0 yg/pr, with an average of 1.0 yg/pr (N=6) for the 4-year period (L. Kiff, *in litt.* 1997; Tordoff *et al.* 1998). In 1998, the first pair of peregrine falcons were located in South Dakota; they produced no young.

Although Texas and Arizona have exceeded their goals for number of pairs, current productivity is below the goal of 1.25 yg/pr and below their long term productivity averages by 44 and 18 percent respectively. Heavy metal contamination, particularly mercury, in adults and nestlings may be depressing productivity in Texas (Andrew Sansom, Texas Parks and Wildlife Department, *in litt.* 1995). Residual mercury contamination from mines operated along the Rio Grande River in the early 1900s is the suspected cause (B. McKinney, pers. comm. 1997). The current productivity level in Arizona is not fully understood, but may be a continuation of the variability exhibited in productivity between 1989 and 1995 (Garrison and Spencer 1996; Bruce Taubert, Arizona Game and Fish Department, pers. comm. 1999).

Kansas and South Dakota are two more States that currently have not met the productivity goal of 1.25 yg/pr. Kansas has had only one peregrine falcon pair since 1992, and breeding is sporadic each year.

Average productivity for the 11 States supporting breeding populations is 1.3 yg/pr, exceeding the goal of 1.25 yg/pr goal. Even though Texas, Kansas, South Dakota and Arizona currently have not met the productivity goal, productivity throughout the Rocky Mountain/Southwest region is more than sufficient for recruitment to exceed mortality, so dramatic population growth has resulted.

In Arizona, eggshells collected between 1978 and 1983 averaged 14.2 percent thinner, and 20 eggshell replicates collected from 1989 through 1994 averaged 13 percent thinner, than pre-DDT era eggshells (Ellis *et al.* 1989, Ward and Siemens 1995). In Colorado and New Mexico, shells from 260 eggs laid between 1977 and 1985 averaged 12 percent thinner than pre-DDT eggshells (Enderson *et al.* 1988). In another analysis of eggs from New Mexico, eggshells collected in 1977 averaged 20 percent thinner than pre-DDT eggshells, but in 1985 averaged only 14 percent thinner (Ponton *et al.* 1988). Eggshells collected in Colorado from 1973 through 1997 were as much as 25.1 percent thinner and at least 6.0 percent thinner than pre-DDT eggshells, with an average thinning of 13.5 percent. Only Colorado has achieved the objective for eggshell thickness. Sampling in Colorado in 1990, 1991, 1992, 1993, and 1994 produced measurements of 10.6, 11.7, 8.6, 8.1, and 6.0 percent thinning respectively, with an average annual mean of 9.0 percent thinning for this period (G. Craig, *in litt.* 1995). Although the recovery objective was not met in other States in the region, there is a general trend toward thicker eggshells in measurements taken since the mid-1970s (L. Kiff, pers. comm. 1995).

The Rocky Mountain/Southwest Recovery Plan did not identify a recovery objective for pesticide residue levels. However, organochlorine pesticide residues in American peregrine falcon eggs measured in Colorado and New Mexico between 1973 and 1979 averaged 26 ppm DDE, but the average declined to 15 ppm by 1980–1983 (Enderson *et al.* 1988). The average DDE concentration in 5 eggs collected in Colorado from 1986 through 1989 was 11 ppm (Jarman *et al.* 1993).

In summary, the first recovery objective in the Rocky Mountain/Southwest Recovery Plan was met; the current population of 535 pairs exceeds the goal of 183 pairs by 352 pairs. These pairs are distributed throughout the Rocky Mountain/Southwest States, meeting or exceeding the population goals in 10 of the 13 States in this

region. The second objective of sustaining a long-term average production of 1.25 yg/pr without manipulation by 1995 was met by all Rocky Mountain/Southwest States that have breeding American peregrine falcons except Texas, Kansas, South Dakota, and Arizona. By the mid-1980s the practice of fostering young into active nests was terminated, therefore, the long-term average productivity this recovery region has experienced was accomplished without nest manipulation. The current reproductive level in the 11 States with breeding populations is 1.3 yg/pr, exceeding the second objective of 1.25 yg/pr. Therefore, we consider the intent of this objective met. Based on the degree of recovery achieved, the third objective, that average eggshell thinning be no more than 10 percent from the pre-DDT era average for 5 years, appears to be conservative. The increase in numbers of American peregrine falcons indicates the subspecies has recovered without the necessity of reaching this specific recovery objective.

*Eastern United States*

The eastern peregrine population has a unique history and complex status under the Act. As stated previously, peregrine falcons were extirpated in the eastern United States and southeastern Canada by the mid-1960s. In 1974, shortly after the passage of the Act, the National Audubon Society sponsored a meeting of experts in peregrine biology, including representatives from the Service, to address the conservation of the species in North America (U.S. Fish and Wildlife Service 1991). This sparked the beginning of an effort to reestablish the peregrine in the eastern United States through the introduction of offspring from parents of multiple subspecies. Peregrine falcons were raised in captivity from parent subspecies then listed as endangered (*Falco peregrinus anatum, F. p. tundrius, F. p. peregrinus*), unlisted subspecies (*F. p. pealei, F. p. brookei, etc.*), and combinations of these subspecies. The first experimental releases of captive-produced young in the eastern States occurred in 1974 and 1975 (Cade 1994). These and future releases, coordinated by the Service, State fish and wildlife agencies, and representatives of The Peregrine Fund, demonstrated that hacking, the practice of retaining and feeding young captive-bred birds in partial captivity until they learn to fly and hunt on their own, was an effective method of introducing captive-bred peregrines to the wild (U.S. Fish and Wildlife Service 1991).

In 1978, we issued a policy statement confirming support for the use of North American peregrines to establish an eastern peregrine falcon population, supported with endangered species funds, and the use of peregrines from other geographic areas for specific research purposes. The policy applied only to peregrine falcons in the east (Keith M. Schreiner, U.S. Fish and Wildlife Service, *in litt.* 1978).

Thus, notwithstanding the similarity of appearance designation, we have continued to fully support the restoration of the eastern peregrine falcon under the 1991 revised Peregrine Falcon Eastern Population Recovery Plan. We have given the eastern peregrine falcon equal consideration with the American peregrine falcon with respect to recovery.

The Peregrine Falcon Eastern Population Recovery Plan (Eastern Plan), first published in 1979, and revised in 1985 and 1991 (U.S. Fish and Wildlife Service 1991), addressed the recovery of the peregrine falcon in the Eastern United States, a population re-established beginning in 1974 and 1975 by releasing captive-bred peregrine falcons of mixed genetic heritage. The recovery plan established two recovery objectives (1) establish a minimum of 20–25 nesting pairs in each of 5 recovery units and sustained them for a minimum of 3 years; and (2) an overall minimum of 175'200 pairs demonstrating successful, sustained nesting. The five recovery units are (1) Mid-Atlantic Coast, (2) Northern New York and New England, (3) Southern Appalachians, (4) Great Lakes, and (5) Southern New England/Central Appalachians.

The first recovery objective is nearly achieved, with three of the five recovery units (Mid-Atlantic Coast, Northern New York and New England, and Great Lakes) surpassing 20 to 25 nesting pairs of peregrine falcons for 3 years. The Mid-Atlantic Coast unit had 65 pairs fledging 110 young in 1998 and averaged 62 pairs and 90 fledglings annually from 1996 through 1998. The Northern New York and New England unit had 50 pairs fledging 70 young in 1998 and averaged 47 pairs and 61 fledglings annually from 1996 through 1998. The Great Lakes unit had 44 pairs fledging 95 young in 1998 and averaged 40 pairs and 74 fledglings from 1996 through 1998. The Southern Appalachians unit had 14 pairs fledging seven young in 1998, and averaged 11 pairs fledging 14 young from 1996 through 1998. The Southern New England and Central Appalachians unit had 20 pairs fledging 26 young in 1998 and averaged 15 pairs fledging 22 young from 1996 through 1998 (L. Kiff, *in litt.* 1997; David Flemming, U.S. Fish and Wildlife Service, *in litt.* 1997; Mike Amaral, U.S. Fish and Wildlife Service, *in litt.* 1999). In 1998, there was a total of 193 pairs counted in the five eastern State recovery units, which was the upper minimum recovery level of the Eastern Plan. The recovery goal, however, was probably met in 1997, because up to 10 percent of territorial pairs in any given year are believed to escape detection and are not counted (Cade *et al.* 1988). Importantly, the number of territorial pairs recorded in the eastern peregrine falcon recovery area has increased an average of 10 per cent annually for the past 7 years (1992–1998). Equally important is that the productivity of these pairs during the same 7-year period has averaged 1.5 yg/pr, thus demonstrating sustained successful nesting.

As of 1998, there were at least 32 nesting peregrine pairs in six midwestern States, which is outside the recovery area delineated in the 1991 Eastern Plan. The birds are nesting successfully in a larger area than was believed likely in 1991. Peregrine falcons now found in midwestern States are the result of captive-reared and released birds, and others that probably came from the peregrine falcons released in the eastern States. However, there appears to be a zone of no nesting in the northeastern Great Plains that separates the western American peregrine falcons from the introduced eastern peregrine falcons (Chuck Kjos, U.S. Fish and Wildlife Service, pers. comm. 1997). There are now more than 225 pairs of peregrine falcons in the midwestern and eastern States where peregrine falcons were extirpated.

*Mexico*

None of the existing recovery plans written for peregrine falcons in North America established recovery criteria for birds that nest in Mexico. There is very little historical or recent information on peregrine falcons in Mexico to accurately assess their current status in Mexico.

Porter *et al.* (1988) reported 42 known nesting territories on the western side of the Baja California Peninsula. From 1966 through 1971, only three pairs occurred in this region and none were found in 1976 (Porter *et al.* 1988), indicating a substantial decline had occurred by the mid-1970s. Most of these territories apparently were checked since that time, but seven pairs were located between 1985 and 1992 in areas not occupied in previous years (Massey and Palacios 1994).

In 1993, three active American peregrine falcon nests were discovered in Ojo de Liebre (Scammon's Lagoon) on the western side of the Baja California Peninsula in an area without historical nesting records (Castellanos *et al.* 1994). The central west coast of the Baja California Peninsula was an important breeding area with a historical population of about 13 pairs (Banks 1969). Between 1980 and 1994, Castellanos *et al.* (1997) conducted breeding surveys of American peregrine falcons in this area of the coast and found 10 nesting pairs. Castellanos *et al.* (1997) studied the reproductive success of three pairs in 1993 and five pairs in 1994 located at Ojo de Liebre and San Ignacio Lagoons. An average of three eggs, 1.8 nestlings, and 1.6 fledglings were produced per nest. This productivity appears to be within the range of normal productivity for healthy populations (Cade *et al.* 1988). These observations suggest some recent recovery on the west coast of the Baja California Peninsula.

On the western (Gulf of California) side of mainland Mexico, Porter *et al.* (1988) reported 23 historical nest sites. A number of new nest sites were found in this area between 1966 and 1984, increasing the number of known nest sites to 51. Territory occupancy averaged about 82 percent between 1967 and 1971 and 77 percent between 1971 through 1975, indicating that territory occupancy in that area never declined as significantly as on the west side of the Baja California Peninsula. Porter and Jenkins (1988) believed that the number of occupied territories in the Gulf area increased after 1967 following a reduction in DDE residues in prey.

Between 1989 and 1997, Robert Mesta, (*in litt.* 1997) found three pairs of American peregrine falcons, one pair on the Rio Aros and two on the Rio Yaqui, Sonora. Hunt *et al.* (1988) found 14 occupied nesting territories in the highlands of northeast Mexico in 1982. In this area and adjacent west Texas, territory occupancy averaged about 70 percent during 1973–1985.

Most of what is known about productivity and pesticide residues in Mexico comes from the western mainland near the Gulf of California. Porter *et al.* (1988) found that productivity along the Gulf of California between 1965 and 1984 was ''somewhat less than normal,'' and five addled eggs collected between 1976 and 1984 averaged 12.8 ppm DDE with a range of 2.4 to 25.0 ppm (Porter and Jenkins 1988). DDE residues in prey in the Gulf area declined from the 1960s to the 1980s, and this decline correlated with increases in productivity and the number of breeding pairs (Porter and Jenkins 1988). Some prey, however, still contained high pesticide residues, and reproduction appeared to be affected by organochlorine at three of 15 nests examined (Porter and Jenkins 1988).

Hunt *et al.* (1988) found that only five of 14 pairs produced young in northeast Mexico in 1982. Hunt *et al.* (1988) reported significant DDE residues in peregrine falcon prey species in western Texas in the mid 1980s, but prey species in Mexico were not sampled.

In summary, there was little research on the distribution, numbers, and status of American peregrine falcons in Mexico, and most research took place in the Baja California Peninsula and the Gulf of California regions. Numbers on the west coast of the Baja California Peninsula declined significantly (Porter *et al.* 1988), but observations suggest that numbers may have increased in recent years (Massey and Palacios 1994; Castellanos *et al.* 1994; and Castellanos *et al.* 1997). In the Gulf of California area, territory occupancy never was known to drop below 77 percent (Porter *et al.* 1988), and it increased in the 1970s and 1980s (Porter and Jenkins 1988).

No information on population trends for American peregrine falcons in Mexico is available. However, the status of the Mexican population may be similar to that of the population occupying similar habitat in nearby Arizona (G. Hunt, pers. comm. 1997). Exposure to organochlorine-based pesticides by Mexico nesting populations continues to be a concern. In 1997, as part of the North American Agreement for Environmental Cooperation, a parallel agreement to the North American Free Trade Agreement between the United States, Canada, and Mexico, the Commission for Environmental Cooperation (CEC) established a North American Regional Action Plan (NARA) on DDT. Mexico, a member nation of the CEC, proposes a phased reduction of DDT (Philip Johnson, U.S. Fish and Wildlife Service, pers. comm. 1999). Specific goals of this reduction are: (1) Reduce the use of DDT for malaria control in Mexico by 80 percent in 5 years (beginning in 1997); (2) eliminate the illegal use of DDT in agriculture in Mexico; (3) develop a cooperative approach to minimize movement of malaria-infected mosquitos across borders and reduce the illegal importation of DDT; and (4) advance global controls on DDT production, export and use.

Adverse effects of organochlorine pesticides in the environment remains an international concern for peregrine falcons nesting in Mexico, and for peregrine falcons wintering in or migrating through Latin America. By undertaking the steps proposed in the NARA, the United States, Canada, and Mexico are committing to ongoing cooperative activities and yearly reporting on progress made on these initiatives and objectives. Annual reports will be submitted to the North American Working Group for the Sound Management of Chemicals and subsequently disseminated to the Council of the Commission for Environmental Cooperation and the public.

*Summary of Peregrine Falcon Recovery*

Five regional peregrine falcon recovery plans, four for American peregrine falcons in Canada and the western United States, and one for the eastern United States introduced peregrine falcon population, were written to guide recovery efforts and establish criteria to be used in measuring recovery. These recovery plans included objectives for population size and reproductive performance. Only two of the recovery plans included specific objectives that applied to pesticide residues in eggs and eggshell thinning. The combined breeding population size goal for the four American peregrine falcon recovery plans is 456 pairs. Currently, a minimum of 1,425 pairs occupy the range of the American peregrine falcon in Alaska, Canada, and the western United States. There are 193 peregrine falcon pairs in the five recovery units included in the Eastern Plan, and an additional 32 peregrine falcon pairs occur in midwestern States in areas not included in the Eastern Plan recovery units. In 1998, the total known breeding population of peregrine falcons was 1,650 pairs in the United States and Canada.

Productivity is an important measure of population health, and each of the four American peregrine falcon recovery regions met or exceeded their respective productivity goals, as did the eastern peregrine population.

Other objectives, including those for pesticide residues in eggs and the degree to which eggshells are thinner than pre-pesticide era eggshells, vary among the plans. In the case of eggshell thinning, current measurements obtained in some areas fall short of recovery objectives. Eggshell thinning was originally suggested by recovery teams as an indicator of whether organochlorine contamination was preventing species recovery. Despite the failure of populations in localized areas to meet recovery objectives, overall, populations of American peregrine

falcons have increased considerably. This increase continues to occur even after reintroduction efforts were curtailed. The consistent and geographically widespread trends in increasing population size demonstrate that current levels of reproductive failure, pesticide residues, and eggshell thinning still affecting American peregrine falcons in some areas have not prevented recovery of the subspecies in North America.

Table 1 summarizes the recovery plan goals for each of the regions and Canada, as well as the current recovery status.

TABLE 1.—AMERICAN PEREGRINE FALCON RECOVERY PLAN GOALS AND CURRENT (1998) RECOVERY STATUS.

| Recovery plan | Delisting goal | Current status | Comments/degree to which delisting goals are met |
|---|---|---|---|
| Alaska: | | | |
| Pairs | 28 pairs in study areas. | 79 pairs in study areas. | Exceeded goal by 51 pairs in study areas. Approximately 301 pairs known State-wide. |
| Productivity (young/pair) | 1.8 yg/pr | 1.9 yg/pr | Exceeded goal. |
| DDT (parts per million) | less than 5 ppm | 3.5 ppm | Exceeded goal. |
| Eggshell thinning | less than 10 percent. | 12.1 percent | Goal not met, but has not prevented recovery; goal probably too conservative. |
| Canada: | | | |
| Pairs | 60 pairs (10 each in 6 zones). | 319 pairs | Exceeded goal by 259 pairs. |
| Productivity | 1.5 yg/pr | 1.8 yg/pr | Exceeded goal. |
| Pacific Coast: | | | |
| Pairs | 185 pairs | 270 pairs | Exceeded goal by 85 pairs. |
| Productivity | 1.5 yg/pr | 1.5 yg/pr | Goal met. |
| Rocky Mountain/Southwest: | | | |
| Pairs | 183 pairs | 535 pairs | Exceeded goal by 352 pairs. |
| Productivity | 1.25 yg/pr | 1.3 yg/pr | Exceeded goal. |
| Eggshell thinning | less than 10 percent. | | Goal measured by only a few States; cannot be assessed. |
| Eastern/Great Lakes: | | | |
| Pairs | 175–200 pairs (with no fewer than 20–25 in each of 5 recovery zones). | 193 pairs | Exceeded goal in 3 zones; goals in other 2 zones probably were met; an additional 32 peregrine falcon pairs occur in several Midwestern States not included under the Eastern Plan. |

**Summary of Issues and Recommendations**

In the August 26, 1998, proposed rule (63 FR 45446), we requested that all interested parties provide information and comments on the status of and proposal to delist the American peregrine falcon. Announcements of the proposed rule were sent to Federal, State, county, and city-elected officials, Federal and State agencies, interested private citizens, and local area newspapers and radio stations. We provided the governments of Canada and Mexico with the proposed rule, and both countries responded with comments. We held public hearings on December 3, 1998, in Wisconsin and December 8, 1998, in New Hampshire. In addition, we solicited formal scientific peer review of the proposal in accordance with our July 1, 1994, Interagency Cooperative Policy for Peer Review in Endangered Species Act Activities (59 FR 34270). We requested three individuals, who possess expertise in peregrine falcon biology, to review the proposed rule by the close of the comment period. All three individuals responded to our request and their comments were incorporated into this final rule.

We considered all comments, including oral testimony at the public hearings. We received a total of 29 oral comments and 893 comment letters from 49 States, and the District of Columbia, Canada, Mexico, Germany, Bali, four Federal agencies, 27 State resource agencies, 305 falconry associations or individual falconers, and 40 conservation organizations. Of the comments received, 633 supported the proposal to delist, 266 opposed the proposal, 11 supported downlisting, and 12 letters duplicated comments from individuals who previously provided oral comments.

Because many respondents offered similar comments, those comments of a similar nature are grouped. These comments, and our responses, are presented below.

*Issue 1:* In the Midwest, delisting will result in less cooperation by building owners and managers to protect peregrine falcons nesting on their buildings.

*Our Response:* Currently, 28 States in the midwestern and eastern United States support nesting peregrine falcons. Approximately 87 percent of the midwestern pairs and 33 percent of the eastern pairs are nesting on manmade structures: bridges, buildings and smokestacks (Martell and McNicoll 1999). Currently, there are 117 nests on nest boxes or trays in 19 States and the District of Columbia. Should delisting the peregrine falcon act as a disincentive for owners and managers to protect nesting peregrine falcons on their buildings, the long-term security of this urban population could be threatened (Martell and McNicoll 1999).

Between January and March of 1999, 75 people with information on 95 of the 117 nest sites were asked if delisting would affect their current management strategies. Responses were overwhelmingly in favor of continuing to manage for the presence of nesting pairs for some of the following reasons: pigeon control, good public relations, positive effect on building employees, and good environmental stewardship (Martell and McNicoll 1999). Survey results do not suggest that delisting of the peregrine falcon would result in widespread removal of nest boxes and trays or discouragement of nesting on manmade structures. Furthermore, the survey found the public widely appreciated and accommodated

peregrines at the manmade structures on which they nest (Martell and McNicoll 1999).

*Issue 2:* Disturbance due to recreational rock climbing poses a threat to nesting peregrine falcons.

*Our Response:* The increasing popularity of rock climbing throughout North America, particularly in the northeast, is becoming a serious problem for land managers trying to protect nesting peregrine falcons. Unlike the western landscape that provides rock climbers with more and larger cliffs and thus some alternatives to conflicts with nesting peregrine falcons, the smaller and limited cliffs of the northeast present fewer alternatives to peregrine/climber conflicts.

The peregrine falcon will still be protected by the MBTA. Additional protection is provided by other laws such as the National Forest Management Act (16 U.S.C. 1600) and the Federal Land Management and Policy Act (43 U.S.C. 1701). These continued protections are adequate to address this threat. See Factor D under Summary of Factors Affecting the Species.

In addition, we are aware of several very effective raptor management plans that were cooperatively developed by land managers, representatives of the climbing community, and other interested parties (plans that contain effective public education components). Some examples include plans developed by the Prescott National Forest in Arizona, Yosemite National Park in California, Adirondack State Park in New York, Zion National Park in Utah, Smith Rock State Park in Oregon, the Nantahala National Forest in North Carolina, and the Colorado National Monument in Colorado. All of these plans include seasonal rock climbing restrictions to prevent disturbance of raptor nests from rock climbing activities. The development of more of these partnerships is essential to the preservation of the peregrine falcon and the sport of rock climbing. Organizations like the Access Fund which represent the climbing community have continued to express a strong desire to work with both private and public land managers to resolve any conflicts originating from the use of cliffs by climbers.

*Issue 3:* The Act's section 6 funds currently being used by States to support peregrine falcon monitoring programs will not be available once the peregrine is delisted.

*Our Response:* We are authorized through the Secretary of the Interior to provide grants to States to assist in monitoring the status of recovered species pursuant to section 4(g) under section 6 of the Act. Existing and future Federal assistance in the form of section 6 funding to States for conservation work will not be affected by the delisting, as long as States continue to identify monitoring peregrine falcons as a high priority.

*Issue 4:* The data do not support delisting the American peregrine falcon throughout its range in the United States. The Service should consider downlisting the American peregrine falcon to threatened rather than delisting.

*Our Response:* Recent data show improvements in numbers of breeding pairs of peregrine falcons and productivity (Refer to Table 1, ''Recovery Status,'' and ''Summary of Peregrine Falcon Recovery''), and demonstrate that goals set for numbers and productivity for the American peregrine falcon recovery plans were met or exceeded. The combined population size goal for the four American peregrine falcon recovery plans is 456 pairs. Currently, a minimum of 1,425 known pairs occupy sites in Alaska, Canada, and the western United States, and a number of additional pairs have probably gone undetected. Overall average productivity goals in all four American peregrine falcon recovery plans, using productivity as a recovery criterion, were met or exceeded.

Only the Alaska recovery plan set a goal for DDT levels, and only two recovery plans (Alaska and Rocky Mountain/Southwest) specified objectives for eggshell thinning. The Alaska Recovery Plan set a delisting goal of less than 5 ppm DDT and less than 10 percent eggshell thinning. Recent data for American peregrine falcon eggs in Alaska indicate DDT levels at less than 3.5 ppm, exceeding that goal, and eggshell thinning is at 12.1 percent. Measurements for eggshell thinning were not consistently taken in the Rocky Mountain/Southwest States. Colorado has met the recovery plan eggshell thinning goal of less than 10 percent; the average of the annual means for 1990–1994 was 9.0 percent. Data for other States show a general trend toward thicker eggshells since the mid-1970s (refer to Rocky Mountain/Southwest section under Recovery Status).

Three of 5 peregrine falcon recovery units in the eastern United States have met recovery goals, and 193 pairs documented in 1998 indicate the overall recovery goal of 175–200 pairs was met. In addition, another 32 pairs are nesting in areas of the Midwest outside the recovery units specified in the Eastern Plan but nevertheless contribute to overall restoration goals.

We believe that the species has essentially achieved the goals established for recovery and, in many areas, has exceeded the goals. We believe the available information supports full delisting of the species throughout its range, and the species clearly is not in danger of extinction, is not likely to become endangered within the foreseeable future throughout a significant portion of its range, and warrants full delisting.

*Issue 5:* American peregrine falcons should not be delisted because they are not restored throughout the historical range.

*Our Response:* We have determined the American peregrine falcon has recovered throughout its historical range. Restoration of the American peregrine falcon within every area throughout its historical range is not required by the Act, is not required for recovery, nor was it a goal of any of the recovery plans. Generally, the goal of a recovery program is to restore the species to a point at which protection under the Act is no longer required. To be recovered, a species must not be endangered with extinction, or be likely to become endangered within the foreseeable future. Although a few, localized areas have not quite met their numerical recovery goals, the overall status of the American peregrine falcon has improved significantly such that it is considered recovered and warrants delisting. As a species recovers in numbers and populations expand, more of the historical range can be re-occupied where appropriate habitat remains.

*Issue 6:* There are gaps in the scientific knowledge about American peregrine falcon biology. A population viability analysis was not done, and genetic diversity, viable population size, population dynamics, and long-term stability of populations have not been determined.

*Our Response:* A complete understanding of the biology of a species is not required to determine a species' conservation status under the Act. Population viability analyses are important tools for attempting to quantify threats to a species, particularly those facing loss and fragmentation of habitat, and the consequences of conservation actions, as well as aiding in identifying critical factors for study, management, and monitoring. These analyses are not always essential, however, to determine when a species has achieved recovery, particularly in the case of the American peregrine falcon. It is evident that

recovery of this subspecies was largely achieved by eliminating the use of DDT and by successful management activities, including the reintroduction of captive-bred American peregrine falcons. Recovery goals established for the species were met or exceeded, with few exceptions.

*Issue 7:* Organochlorine pesticides still persist within the breeding range of the American peregrine falcon and continue to depress natural productivity.

*Our Response:* We recognize that although the peregrine falcon has made a dramatic recovery throughout its historical range in the United States, the presence of environmental contaminants is still affecting the productivity of certain regional populations. Eggs collected on the eastern shore of Virginia and Maryland had slightly elevated levels of DDE, dieldrin, and mercury, which was associated with reproductive problems (U.S. Fish and Wildlife Service 1994). On the Channel Islands in California, particularly Catalina, populations are still affected by organochlorine residues and eggshell thinning (Jarman 1994). In west Texas, heavy metal contamination, particularly mercury may be depressing productivity (A. Sansom, *in litt.*1995). Residual mercury from mines operated along the Rio Grande River in the early 1900s is the suspected source of this contamination (B. McKinney, pers. comm. 1997). We recognize the possible threat that environmental contaminants pose to the sustained recovery of this species and therefore, will include a contaminant monitoring component in the post-delisting monitoring plan. Refer to Factor E under Summary of Factors Affecting the Species, for an in-depth discussion of contaminants. See also our response to issue 8.

*Issue 8:* The continued unrestricted use of organochlorine pesticides in Latin America places the American peregrine falcon at risk of contamination while on migration and on its wintering grounds.

*Our Response:* Comparisons of blood samples collected during fall and spring migration indicate that, although migrant peregrine falcons are known to accumulate pesticides while wintering in Latin America, DDE residues in the blood taken from female peregrine falcons captured during spring migration at Padre Island, Texas decreased between 1978 and 1994 below levels that would affect reproduction (Henny *et al.* 1996). Despite the use of organochlorines in Latin America, the American peregrine falcon has recovered over its historical range, and Arctic peregrine falcons, which also winter in Latin America, were delisted due to their recovery. Refer to Factor E under Summary of Factors Affecting the Species for an in-depth discussion. The North American Working Group for the Sound Management of Chemicals promotes a regional perspective that encourages the active involvement of Central and South American countries in the implementation of the North American Regional Action Plan on DDT, and is facilitating international cooperation on combating malaria in these regions without the continued use of organochlorine pesticides. This effort could eventually eliminate or reduce one source of DDT in Central and South American countries.

*Issue 9:* The take of American peregrine falcons for falconry after its delisting will create an additional threat to the subspecies.

*Our Response:* Delisting the American peregrine falcon will not affect the protection given to all migratory bird species, including the peregrine falcon, under the MBTA. The regulations issued pursuant to the MBTA allow for issuance of permits to take raptors for falconry and other purposes provided the taking will not threaten wildlife populations (50 CFR 21.28 and 13.21(b)). Currently we are working with State wildlife agencies to develop biological criteria and two management plans to govern the issuance of permits for take of peregrine falcons to ensure the taking does not negatively impact wild populations, particularly those in need of further restoration. The first management plan will deal with the take of eyas (nestling) peregrines. A second management plan will deal with the take of passage (migrating first-year) peregrines. The management plans will include criteria for harvest, implementation criteria, and procedures for evaluating effects of the harvest. They will pertain to the take of all wild peregrine falcons in the U.S., including the American peregrine falcon, and will apply to all falconry, raptor propagation, and scientific collecting permits. Take will not be permitted under the MBTA until the draft management plans undergo public review, are approved, finalized, and published in the **Federal Register**. Some exceptions may be made on a case-by-case basis for scientific purposes. The effects of take for all purposes will be assessed during the monitoring period following delisting. Refer to Factor D under the Summary of Factors Affecting the Species section and the Effects of This Rule section for further information.

*Issue 10:* The Canadian Wildlife Service has expressed concern that American peregrine falcons breeding in Canada but migrating to or through the United States will be taken for falconry purposes.

*Our Response:* Canada's recovery program for American peregrine falcons is still in progress and the Canadian government is concerned that any take of American peregrines migrating from Canada could impact recovery. We are working with the governments of Canada and Greenland in considering the appropriateness of harvest of peregrines migrating through the United States. If take of these passage birds is approved, it would be designed to avoid take of American peregrines originating in Canada and instead target the more abundant Arctic peregrines from northern Alaska, Canada, and Greenland.

*Issue 11:* The Service cannot consider delisting the American peregrine falcon until all recovery goals in the four existing recovery plans for this subspecies are met or exceeded.

*Our Response:* Section 4(f) of the Act directs us to develop and implement recovery plans for species of animals or plants listed as endangered or threatened. Recovery is the process by which the decline of an endangered or threatened species is arrested or reversed and threats to its survival are neutralized so that long-term survival in nature can be ensured. The goal of this process is the maintenance of secure, self-sustaining wild populations of species with the minimum investment of resources. One of the main purposes of the recovery plan is to enumerate goals (guidelines) that will help us to determine when recovery for a particular species is achieved. Meeting or exceeding all of the specific recovery goals for a listed species is not required by the Act before delisting can occur.

We determine whether recovery is achieved based on a species' performance relative to the goals set in its recovery plan and the best available scientific information. A species is considered recovered when it is no longer in danger of extinction (i.e., endangered), or likely to become endangered within the foreseeable future throughout all or a significant portion of its range (i.e., threatened). The American peregrine falcon has either met, exceeded, or is very close to meeting the recovery goals set for this subspecies throughout its range. We believe that the intent of all the objectives are met and that the recovery of the subspecies justifies delisting.

*Issue 12:* The eastern peregrine falcon population has not met the recovery goals set forth in the Eastern Recovery

Plan and, therefore, should remain on the endangered species list.

*Our Response:* The eastern peregrine falcon population is protected only due to the similarity of appearance to *F. p. anatum*, which has protected individual eastern peregrine falcons from direct take. Thus, their status with respect to recovery has no direct impact on the decision to delist the American peregrine falcon. Nevertheless, we have supported and still fully support the restoration of this population.

Data through 1998 on the status of the eastern peregrine falcon population indicate that the intent of the recovery goals set for this population are met. The recovery plan established 2 recovery objectives including (1) a minimum of 20–25 nesting pairs in each of 5 recovery units which are established and sustained for a minimum of 3 years, and (2) an overall minimum of 175–200 pairs demonstrating successful, sustained nesting. Three of the five recovery units (Mid-Atlantic Coast, Northern New York and New England, and Great Lakes) have surpassed the nesting pair goal for 3 years. The Southern Appalachians and Southern New England/Central Appalachians units may not yet have achieved the goals established for the number of breeding pairs for those areas. However, the overall minimum of 175–200 successful pairs in the eastern region was achieved, and over the past 6 years (1992–1998), the number of territorial pairs has increased an average of 10 percent annually. There are now at least 193 pairs of peregrine falcons in the eastern States where falcons were extirpated, and pairs are successfully nesting throughout a greater range than was anticipated. We believe the intent of the recovery objectives are satisfied and that recovery of the peregrine in the eastern United States is sufficiently established. Refer to the Recovery Status section for additional discussion on this subject.

*Issue 13:* The status of the American peregrine falcon in Mexico was not adequately addressed.

*Our Response:* While population status and trends for falcons nesting in Mexico are not well known, American peregrine falcon populations in the United States and Canada, including those migrating to and from Latin America, have met or exceeded their criteria for delisting. Restoration of the American peregrine falcon within every area throughout its historical range is not required by the Act, nor is it required for recovery. Mexico's proposed phased reduction of DDT under the North American Regional Action Plan will make a significant contribution toward increasing peregrine falcon populations in Mexico. Refer to the Mexico section under Recovery Status for additional discussion on this subject.

*Issue 14:* The Service's delisting proposal is not supported by an adequate scientific review.

*Our Response:* The proposed rule to remove the peregrine falcon in North America from the Federal List of Endangered and Threatened Wildlife received reviews from a variety of scientific institutions and individual scientists. Two examples are the Ornithological Council and the Raptor Research Foundation. The Ornithological Council consists of nine leading scientific ornithological societies: the American Ornithologists' Union, Association of Field Ornithologists, Consejo Internacional para la Preservaciòn de las Aves, Cooper Ornithological Society, Colonial Waterbird Society, Pacific Seabird Group, Raptor Research Foundation, Society of Caribbean Ornithology, and Wilson Ornithological Society. Together it has a membership of approximately 6,500 ornithologists. One of its primary missions is to provide scientific information about birds to legislators, regulatory agencies, industry decision makers, conservation organizations and others, and to promote the use of scientific information in the making of policies that affect birds.

The task of evaluating the proposed rule on behalf of the Ornithological Council was accepted by a committee of Raptor Research Foundation scientists. The Raptor Research Foundation is a scientific society that represents professional raptor scientists and managers throughout North America and around the world. This committee of raptor scientists reviewed the available data and submitted a report that was endorsed by both the Ornithological Council and the Raptor Research Foundation as their position on the proposed rule. This report underwent peer review and was published in the Wildlife Society Bulletin (Millsap *et al.*, 1998, WSB 26(3); 522–538). While expressing some concern about the status of the eastern peregrine population, the authors concurred with our position that the peregrine falcon warranted delisting range-wide.

*Issue 15:* Recovery plans used to evaluate the recovery of the peregrine falcon are out of date and need to be revised to reflect more accurate contemporary goals and the Service should not misrepresent the goals in the current plans.

*Our Response:* As addressed in our response to Issue 11, section 4(f) of the Act directs us to develop and implement recovery plans for species of animals or plants listed as endangered or threatened. Recovery is the process by which the decline of an endangered or threatened species is arrested or reversed and threats to its survival are neutralized so that long-term survival in nature can be ensured. One of the main purposes of the recovery plan is to enumerate goals (guidelines) that will help us to determine when recovery of a particular species is achieved. Meeting or exceeding all of the specific recovery goals for a listed species before it can be delisted is not required by the Act. Section 4 of the Act and regulations (50 CFR Part 424) promulgated to implement the listing provisions of the Act, establish the procedures for listing, reclassifying, and delisting species. We may list a species if one or more of the five factors described in section 4(a)(1) of the Act threatens the continued existence of the species. A species may be delisted, according to 50 CFR 424.11(d), if the best scientific and commercial data available substantiate that the species is neither endangered or threatened because of (1) extinction, (2) recovery, or (3) the original data for classification of the species were in error. We have determined that substantial peregrine falcon recovery has taken place, and none of the five factors addressed in section 4(a)(1) of the Act is currently negatively affecting the peregrine falcon to the degree that the species is endangered or threatened.

*Issue 16:* Post-delisting monitoring for at least 5 years is essential.

*Our Response:* We agree. Section 4(g)(1) of the Act requires the Secretary to implement a system, in cooperation with the States, to monitor for not less than 5 years the status of all species which have recovered to the point that protection of the Act is no longer required (section 4(g)). If it becomes evident during the course of the post-delisting monitoring that the species again requires the protection of the Act, it would be relisted.

**Summary of Factors Affecting the Species**

Section 4 of the Act and regulations (50 CFR Part 424) promulgated to implement the listing provisions of the Act, set forth the procedures for listing, reclassifying, and delisting species on the Federal lists. We may list a species if one or more of the five factors described in section 4(a)(1) of the Act threatens the continued existence of the species. A species may be delisted, according to 50 CFR 424.11(d), if the

best scientific and commercial data available substantiate that the species is neither endangered or threatened because of (1) extinction, (2) recovery, or (3) the original data for classification of the species were in error.

After a thorough review of all available information, we have determined that substantial peregrine falcon recovery has taken place since the early 1980s. We determined that none of the five factors addressed in section 4(a)(1) of the Act, and discussed below, is currently affecting the species, including the American peregrine falcon subspecies and introduced peregrine falcon populations, such that the species is no longer endangered (in danger of extinction throughout all or a significant portion of its range) or threatened (likely to become endangered in the foreseeable future throughout all or a significant portion of its range). These factors and their application to the peregrine falcon in North America are as follows:

*A. The Present or Threatened Destruction, Modification, or Curtailment of Its Habitat or Range*

Peregrine falcons occupy a variety of habitat types and nest from the boreal forest region of Alaska and Canada, through much of Canada and the western United States, south to parts of central and western Mexico. Nesting habitat includes cliffs and bluffs in boreal forests, coastal cliffs and islands, urban skyscrapers and other structures, and cliffs and buttes in southwestern deserts. In some breeding areas, such as the southern United States, some or all of the birds remain year-round on their nesting territories. In other breeding areas, particularly in high latitudes, many or all of the individuals are highly migratory; these individuals occupy a number of regions and habitat types throughout the year as they nest, migrate to and from wintering areas, and occupy their wintering ranges. Due to the extensive geographic distribution of the peregrine falcon, the wide variety of habitat types in which the species nests, and the immense area that some of the more migratory individuals occupy during a year, the peregrine falcon occupies an extremely broad array of areas and habitats throughout its range. As a result, the degree to which peregrine falcons were affected by human-caused habitat modification varies widely by region, habitat type, and individual falcons within the population.

As the human population has grown in North America, the rate of habitat alteration has unquestionably increased. Certainly some peregrine falcon habitat was destroyed, such as the many wetlands drained in recent years that were previously used by peregrine falcons for foraging or as migratory staging areas during spring and fall. But peregrine falcons have colonized many cities in North America due to the abundance of nest sites on buildings and the abundance of prey, such as rock doves (*Columba livia*), that thrive in urban areas. Therefore, some forms of habitat modification have negatively affected peregrine falcons while other forms have benefited them. It would be burdensome to estimate the net, overall effect of habitat modification on the species throughout North America.

Although the rate of habitat modification in North America has increased in recent decades, the number of American peregrine falcons occupying the region has increased substantially since the late 1970s or early 1980s. In several parts of their range, including parts of Alaska, the Yukon and Northwest Territories, California, and the southwestern United States, the number of breeding pairs has increased rapidly in recent years, and some local populations now occur at very high densities (R. Ambrose, pers. comm. 1997; G. Holroyd, pers. comm. 1997; Enderson *et al.* 1995). Because these rapid population growth rates and high densities were achieved despite habitat modification in North America, we conclude that habitat modification or destruction was not a limiting factor in peregrine recovery. It does not currently threaten the existence of the American peregrine falcon nor is it likely to in the foreseeable future.

*B. Overutilization for Commercial, Recreational, Scientific, or Educational Purposes*

Delisting the peregrine falcon will not result in overutilization because the delisting will not affect protection provided the peregrine falcon by the MBTA. The take of all migratory birds, including peregrine falcons, is governed by the MBTA's regulations on the taking of migratory birds for educational, scientific, and recreational purposes and requiring harvest be limited to levels that prevent overutilization (See Factor D).

*C. Disease or Predation*

Peregrine falcons are susceptible to a number of diseases and parasites such as tapeworms, mites, ticks, botulism, fowl pox, and viral encephalitis (U.S. Fish and Wildlife Service 1982b; Trainer (1969) as cited in U.S. Fish and Wildlife Service 1984). However, these organisms are not known to affect the peregrine falcon at the population level.

Mammals and other raptors are known to prey on peregrine falcons, including such species as the great horned owl (*Bubo virginianus*), red-tailed hawk (*Buteo jamaicensis*), raccoon (*Procyon lotor*), and coyote (*Canis latrans*) (U.S. Fish and Wildlife Service 1982b, 1984). For example, great horned owls are natural predators of peregrine falcons (U.S. Fish and Wildlife Service 1991) and are possibly responsible for the slow recovery of peregrine falcons in the two northern recovery areas in the reestablished eastern population (M. Amaral *in litt.* 1995). Great horned owl predation was not documented as a significant cause of the decline in peregrine falcons and has not affected the species' overall recovery.

Golden eagles (*Aquila chrysaetos*) are also known to prey on young peregrine falcons. Barbara Behan (U.S. Fish and Wildlife Service, pers. comm. 1999) witnessed a golden eagle prey on young peregrine falcons at a hack site in Colorado, stooping and footing one of the falcons, and leaving the area with it in its talons. The same eagle, or another, returned numerous times over the next several days, and the other four falcons disappeared in that time, despite efforts by the hack site attendants to scare the eagles away from the site.

Though the peregrine falcon is occasionally preyed upon, this factor is not known to affect the peregrine falcon at the population level.

*D. The Inadequacy of Existing Regulatory Mechanisms*

Protection from take and commerce for the peregrine falcons under the Endangered Species Act will be removed upon delisting. However, peregrine falcons are still protected by the MBTA. Section 704 of the MBTA states that the Secretary of the Interior is authorized and directed to determine if, and by what means, the take of migratory birds is allowed and to adopt suitable regulations permitting and governing the take. In adopting regulations, the Secretary is to consider such factors as distribution and abundance to ensure that take is compatible with the protection of the species.

The MBTA and its implementing regulations (50 CFR Parts 20 and 21) prohibit take, possession, import, export, transport, selling, purchase, barter, or offering for sale, purchase or barter, any migratory bird, their eggs, parts, and nests, except as authorized under a valid permit (50 CFR 21.11). Regulations at 50 CFR 21.28 and 21.30 authorize the issuance of permits to take, possess, transport and engage in

commerce with raptors for falconry and for propagation. Other regulations authorize the issuance of permits for scientific collecting (50 CFR 21.23), special purposes such as rehabilitation or education (50 CFR 21.27), and depredation (50 CFR 21.41). Prior to issuance of these permits, meeting certain criteria is required, including a requirement that the issuance will not threaten a wildlife population (50 CFR 13.21(b)(4)). In cooperation with State wildlife agencies we will develop draft biological criteria for management of take of wild peregrines under the MBTA. The resulting management plans will include biological criteria for take, implementation criteria, and procedures for evaluating the effects of the taking. It will pertain to the take of peregrines in the United States for falconry and other purposes. With limited exceptions, take will not be permitted under MBTA until the draft management plans undergo public review, are approved, finalized, and published in the **Federal Register**. In addition to considering the effect on wild populations, issuance of raptor propagation permits requires that we consider whether suitable captive stock is available and whether wild stock is needed to enhance the genetic variability of captive stock (50 CFR 21.30(c)(4)).

These existing regulatory provisions will adequately protect against excessive take of peregrine falcons. If necessary, protective measures could be expanded by promulgation of a regulation under the MBTA. We have both the legal authority and the obligation to regulate take of peregrines under the MBTA (see additional discussion of the MBTA in the Effects of this Rule section below).

In the absence of habitat protection under the Act, there are no other existing Federal laws that specifically protect the habitat of this species (see ''Critical Habitat''). However, loss of habitat was not identified as a threat to the species and was not a factor identified as contributing to the species' listing.

An important regulatory mechanism affecting peregrine falcons is the requirement that pesticides be registered with the Environmental Protection Agency (EPA). Under the authority of the Federal Insecticide, Fungicide, and Rodenticide Act (7 U.S.C. 136), the EPA requires environmental testing of all new pesticides. Testing the effects of pesticides on representative wildlife species prior to pesticide registration is specifically required. This protection from effects of pesticides are not altered by delisting the peregrine falcon.

On July 1, 1975, peregrine falcons were included in Appendix I of the Convention on International Trade in Endangered Species of Wild Fauna and Flora. This treaty was established to prevent international trade that may be detrimental to the survival of plants and animals. Generally, both import and export permits are required by the importing and exporting countries before an Appendix I species may be shipped, and Appendix I species may not be imported for primarily commercial purposes. Although CITES does not itself regulate take or domestic trade, CITES permits may not be issued if the export will be detrimental to the survival of the species or if the specimens were not legally acquired. This protection is not be altered by delisting the peregrine falcon under the Act.

Peregrine falcons are still afforded some protection by land management agencies under laws such as the National Forest Management Act (16 U.S.C. 1600) and the Federal Land Management and Policy Act (43 U.S.C. 1701). National Forest Management Act regulations specify that ''fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired non-native vertebrate species in the planning area.'' (36 CFR 219.19). Guidelines for each planning area must provide for a diversity of plant and animal communities based on the suitability of a specific land area. United States Forest Service regional foresters are responsible for identifying sensitive species occurring within their Region. Sensitive species are those that may require special management emphasis to ensure their viability and to preclude trends toward endangerment that would result in the need for Federal listing. The delisting of the peregrine falcon will require Federal land managers to consider the need for designating the peregrine falcon as a sensitive species to ensure that forest management activities do not contribute to a need for relisting. The Federal Land Policy and Management Act requires that public lands be managed to protect the quality of scientific, ecological, and environmental qualities, among others, and to preserve and protect certain lands in their natural condition to provide food and habitat for fish and wildlife.

Federal delisting of the peregrine falcon will not remove the peregrine falcon from State threatened and endangered species lists, or suspend any other legal protections provided by State law. States may have more restrictive laws protecting wildlife, including restrictions on use for falconry, and may retain State threatened or endangered status for the peregrine falcon (see 50 CFR 21.28). Depending on the biological status, States generally list peregrine falcons as endangered, threatened, critically imperiled or as a species of concern. Currently, the peregrine falcon is State-listed in 38 of the 40 States that have nesting pairs. The two States that do not have the species listed—Colorado and Arizona—removed the peregrine falcon from their lists due to its recovery in those States. However, both will continue to regulate take for falconry and other purposes. In many States, falconry is administered cooperatively by the Service and the States.

*E. Other Natural or Manmade Factors Affecting Its Continued Existence*

Egg collecting, shooting, harvest for falconry, habitat destruction, climate change, and the extinction of passenger pigeons were all considered as possible factors causing or contributing to the decline in peregrine falcon populations in North America; however, no evidence supports any of these factors as causing the widespread reproductive failure and population decline that occurred. In contrast, an overwhelming body of evidence has accumulated showing that organochlorine pesticides affected survival and reproductive performance sufficiently to cause the decline. There currently is no question within the scientific community that contamination with organochlorines was the principal cause for the drastic declines and extirpations in peregrine falcon populations that took place in most parts of North America (Kiff 1988).

Although the use of all organochlorine pesticides causing reproductive failure in peregrine falcons was restricted in the United States and Canada in the early 1970s, their use continues in some areas of Latin America. It was shown, by comparing blood samples collected during fall and spring migration, that migrant peregrine falcons accumulate organochlorines while wintering in Latin America (Henny *et al.* 1982). Henny *et al.* (1996) demonstrated that DDE residues in the blood taken from female peregrine falcons captured during spring migration at Padre Island, Texas decreased between 1978 and 1994. In second-year peregrines, residues dropped from 1.43 ppm between 1978 and 1979 to only 0.25 ppm in 1994 and from 0.88 to 0.41 ppm for older peregrines; these levels are well below those that would affect reproduction (Henny *et al.* 1996).

The widespread reproductive failure and population decline of peregrine

falcons in North America coincided with the period of heavy organochlorine use in the United States. Although there was not an immediate lowering of pesticide residues in eggs following restrictions on the use of organochlorines north of Mexico (Enderson *et al.* 1995), residues gradually declined following the restrictions (Ambrose *et al.* 1988b; Enderson *et al.* 1988; Peakall *et al.* 1990), and most surviving populations began to increase in size thereafter. Despite the continued use of organochlorines in Latin America, populations of American peregrine falcons in North America have recovered substantially in recent years. In fact, Arctic peregrine falcons that winter predominantly in Latin America recovered to the point that the subspecies was removed from the Federal List of Threatened and Endangered Wildlife on October 4, 1994 (59 FR 50796).

Additionally, some of the avian prey used during the nesting season by peregrine falcons throughout North America also winter in Latin America. Many of these prey return to their nesting areas with pesticide residues accumulated during the winter (Fyfe *et al.* 1990). Peregrine falcons preying upon these birds during the summer are further exposed to Latin American pesticides. Overall, pesticide use in Latin America does not appear to have adversely affected reproductive success in American peregrine falcon populations in North America.

We recognize that certain populations of American peregrine falcons have recovered to a lesser degree, and that in some of these populations organochlorine residues are still high and reproductive rates remain lower than normal. Populations on the Channel Islands off southern California are still affected by high organochlorine residues and eggshell thinning (Jarman 1994). This is a localized threat, and the result of using offshore islands as DDT disposal areas during the 1940s. Despite the residual effects of organochlorines on the Channel Islands, this population is continuing to increase, although some of the increase could be the result of the release of a significant number of captive-bred young or dispersal from other areas where recovery is greater (B. Walton, pers. comm. 1997). Based on published values in the literature, detected concentrations of DDT in peregrine falcon eggs collected in New Jersey were sufficient to impact reproduction. Productivity and eggshell thinning data, however, did not support a conclusion of reproductive impairment due to DDT contamination (U.S. Fish and Wildlife Service and New Jersey Department of Environmental Protection 1997). Jarman (1994) suggested that these locally higher egg residues result from a local source of DDT or DDE. As a result, the effects are localized, and the observations do not reflect the current status of peregrine falcons as a whole. In recent years, numbers of peregrine falcons have increased significantly throughout their historical range despite the effects of localized organochlorine residues.

Similarly, American peregrine falcons in southwest Canada have not recovered as well as in most other regions of North America. Despite the release of several hundred captive-bred young in the prairie Provinces and western Canada (Holroyd and Banasch 1990), the number of pairs occupying territories is still well below the number of known historical nest sites (G. Holroyd, *in litt.* 1993). In southern Canada, including the prairie region, the proportion of reintroduced young that entered the breeding population was considerably lower than in the United States (Peakall 1990; Enderson *et al.* 1995). The factor or factors causing this lower recruitment rate remain unknown, but survivorship of peregrine falcons released into this area may be lower than in adjacent portions of the subspecies' range. Pesticide residues in American peregrine falcon eggs do not appear to be higher in southwest Canada than in the United States (Peakall *et al.* 1990). Therefore, higher residual organochlorine contamination is apparently not responsible, and the number of pairs occupying this region continues to increase.

Exposure to organochlorine pesticides caused drastic population declines in peregrine falcons. Following restrictions on the use of organochlorines in the United States and Canada, residues in eggs declined and reproduction rates improved. Improved reproduction, combined with the release of thousands of captive-reared young and relocated wild hatchlings, allowed the American peregrine falcon to recover and peregrine falcons to be successfully reestablished in those areas of the historical range from which the species was extirpated. Pesticide residues, reproductive rates, and the rate of recovery have varied among regions within the vast range of this species. In some areas, such as the Channel Islands off the southern coast of California, the lingering effects of DDT have caused reproductive rates to remain low. Local source contamination may even cause continued reproductive problems in the Channel Islands. In southwest Canada, the rate of recovery, or onset of recovery, apparently lagged behind most other areas, but recent trends suggest that historical nest sites will continue to be gradually re-colonized.

The peregrine falcon has recovered throughout its historical range. Although the recovery is slow in a few parts of the historical range, these areas represent a small portion of the species' overall range. Furthermore, evidence collected in recent years shows that a combination of lingering residues of organochlorines in North America and contamination resulting from the continued use of organochlorines in Latin America has not prevented a widespread and substantial recovery of peregrine falcons, as numbers of peregrine falcons continue to increase. We conclude, therefore, that the continued existence of the American peregrine falcon is no longer threatened by exposure to organochlorine pesticides.

In summary, due to the reduction in the effects of pesticides and widespread positive trends in population size, we have determined that the American peregrine falcon has recovered and is no longer endangered with extinction, or likely to become endangered within the foreseeable future throughout all or a significant portion of its range. We considered the alternative of downlisting the species, but recent data show improvements in breeding pair numbers and productivity, demonstrating that the delisting goals set for the American peregrine falcon in recovery plans were met or exceeded. We believe this available information supports the full delisting of the species throughout its range. Therefore, we are removing the peregrine falcon from the Federal List of Endangered and Threatened Wildlife, thus, removing endangered status for the American peregrine falcon throughout its range, and the similarity of appearance provision for all free-flying peregrine falcons within the 48 conterminous United States.

In accordance with 5 U.S.C. 553(d), we have determined that this rule relieves an existing restriction and good cause exists to make the effective date of this rule immediate. Delay in implementation of this delisting would cost government agencies staff time and monies conducting formal section 7 consultation on actions which may affect species no longer in need of the protections under the Act. Relieving the existing restriction associated with this listed species will enable Federal agencies to minimize any further delays in project planning and implementation for actions that may affect peregrine falcons.

**Effects of This Rule**

This final rule will affect the protection afforded to North American peregrine falcons under the Act. It will not affect the status of the Eurasian peregrine falcon (*F. p. peregrinus*), currently listed under the Act as endangered wherever it occurs. The endangered designation under the Act for the American peregrine falcon will be removed and the designation of endangered due to similarity of appearance for all free-flying peregrine falcons found within the 48 conterminous United States, including the Arctic and Peale's peregrine falcons, and the reestablished eastern and midwestern populations, will be removed. Therefore, taking, interstate commerce, import, and export of North American peregrine falcons will no longer be prohibited under the Act. In addition, Federal agencies will no longer be required to consult with the Service under section 7 of the Act in the event activities they authorize, fund or carry out adversely affect peregrine falcons. However, as previously discussed, removal of the protection of the Act will not affect the protection afforded all peregrine falcons under the MBTA.

The take and use of peregrine falcons must comply with appropriate State regulations. State regulations applying to falconry vary among States and are subject to change over time. The applicable State regulations may be more but not less restrictive than Federal regulations.

This rule will not affect the peregrine falcon's Appendix I status under CITES, and CITES permits will still be required to import and export peregrine falcons to and from the United States. CITES permits will not be granted if the export will be detrimental to the survival of the species or if the falcon was not legally acquired.

**Critical Habitat**

Critical habitat for the American peregrine falcon includes five areas in northern California (50 CFR 17.95). The Act defines critical habitat as ''specific areas within the geographical area occupied by the species, at the time it is listed on which are found those physical or biological features essential to the conservation of the species and which may require special management considerations or protection.'' Since critical habitat can be designated only for species listed as endangered or threatened under the Act, all currently designated American peregrine falcon critical habitat will be removed upon publication of this final rule.

**Monitoring**

Section 4(g)(1) of the Act requires us to monitor a species for at least 5 years after delisting. A monitoring plan was provided in the proposed delisting rule on August 26, 1998 (63 FR 45446). We are currently developing a revised monitoring plan which will be made available for public review in the **Federal Register** in the near future.

**Take for Falconry and Other Purposes**

Wild American and Arctic peregrine falcons were unavailable for falconry and raptor propagation in the contiguous United States since these two subspecies of peregrine falcons were listed under the Act in 1970. In Alaska, the Arctic peregrine became available for take in 1994 when it was delisted, but take of this subspecies was still restricted in the contiguous United States pursuant to the similarity of appearance provision of the Act. Take of Peale's peregrines also was restricted in the contiguous United States since 1984 pursuant to the similarity of appearance provisions of the Act.

With this delisting, which removes protection of the Act, regulation and management of peregrine falcons in the United States will fall primarily under the MBTA and State regulations. In anticipation of delisting, we are working with the State wildlife agencies to develop draft biological criteria for management of take of peregrines. These criteria will serve as the basis for discussions with authorities in Canada and Greenland to identify appropriate limits for take of passage birds. We will then prepare environmental assessments on the management of nestlings and passage birds and solicit public comment. The resulting management plans will include biological criteria for harvest, implementation criteria, and procedures for evaluating the harvest. One objective of the plans is to allow a level of take that does not compromise continuing restoration of peregrine falcons in North America. We expect to complete the management plan for nestlings by the Spring of 2000, and the management plan for passage birds by the Fall of 2000. Take of peregrine falcons in the conterminous United States is not permitted under the MBTA until the management plans undergo public review and are finalized, approved, and published in the **Federal Register**. Some permit exceptions may be made for scientific research. In Alaska, take of American peregrine falcons is not permitted but take of Peale's and Arctic peregrines may be authorized.

**Executive Order 12866**

This rule was not reviewed by the Office of Management and Budget under Executive Order 12866.

**Paperwork Reduction Act**

Office of Management and Budget (OMB) regulations at 5 CFR 1320, which implement provisions of the Paperwork Reduction Act, require that interested members of the public and affected agencies have an opportunity to comment on agency information collection and recordkeeping activities (see 5 CFR 1320.8(d)). We cannot conduct or sponsor, and a person is not required to respond to a collection of information, unless we are in possession of a current OMB Control Number. We intend to collect information from the public during the post-delisting monitoring period. A description of the information that will be collected was provided in the proposed delisting rule. We are revising the monitoring plan that was described in the proposed delisting rule, and will obtain a revised OMB Control Number for, and request public comment on, the revised monitoring plan in the **Federal Register** in the near future.

**National Environmental Policy Act**

We have determined that an environmental assessment or environmental impact statement, as defined under the authority of the National Environmental Policy Act of 1969, need not be prepared in connection with regulations adopted pursuant to section 4(a) of the Endangered Species Act of 1973, as amended. We published a notice outlining our reasons for this determination in the **Federal Register** on October 25, 1983 (48 FR 49244).

**References Cited**

A list of all references cited herein is available upon request from the Ventura Fish and Wildlife Office (see **ADDRESSES** section).

**Author**

The primary author of this proposed rule is Robert Mesta, U.S. Fish and Wildlife Service, Ventura Fish and Wildlife Office (see **ADDRESSES** section).

**List of Subjects in 50 CFR Part 17**

Endangered and threatened species, Exports, Imports, Reporting and recordkeeping requirements, Transportation.

**Regulation Promulgation**

For the reasons set out in the preamble, we hereby amend part 17, subchapter B of chapter I, Title 50 of the

Code of Federal Regulations, as set forth below:

## PART 17—[AMENDED]

1. The authority citation for part 17 continues to read as follows:

**Authority:** 16 U.S.C. 1361–1407; 16 U.S.C. 1531–1544; 16 U.S.C. 4201–4245; Pub. L. 99–625, 100 Stat. 3500; unless otherwise noted.

**§ 17.11 [Amended]**

2. Section 17.11(h) is amended by removing the entries for ''Falcon, American peregrine, *Falco peregrinus anatum*'' and ''Falcon, peregrine, *Falco peregrinus*'' under ''BIRDS'' from the List of Endangered and Threatened Wildlife.

**§ 17.95 [Amended]**

3. Section 17.95(b) is amended by removing the critical habitat entry for ''American Peregrine Falcon.''

Dated: August 17, 1999.

**Jamie Rappaport Clark,**

*Director, U. S. Fish and Wildlife Service.*

August 22, 2011

Mr. Mark Wolfe
State Historic Preservation Officer
Texas Historical Commission
108 West 16th Street, 1st Floor
Austin, TX 78701

Subject: **Texas Historical Commission Review – McCombs Landfill**

Dear Mr. Wolfe:

On behalf of the City of El Paso (City), SAIC Energy, Environment and Infrastructure, LLC (SAIC) requests a consultation under Section 106 of the National Historic Preservation Act and the Antiquities Code of Texas for the City's McCombs Landfill (Landfill) in El Paso, Texas. A Request for a State Historical Preservation Officer (SHPO) Consultation Form and any additional required information is provided as an attachment to this letter for your review.

Please do not hesitate to contact Scott Pasternak at (512) 651-6405 with any questions or clarifications regarding this Texas Historical Commission review.

Sincerely,

**SAIC Energy, Environment & Infrastructure, LLC**

Scott Pasternak
Senior Project Manager

*SAIC Energy, Environment & Infrastructure, LLC*
*5806 Mesa Drive, Suite 310 | Austin, TX 78731 | tel: 512.450.0991 | fax: 512.450.0515 | saic.com/EEandI*

**TEXAS HISTORICAL COMMISSION**

# REQUEST FOR SHPO CONSULTATION:
# Projects Subject to Section 106 of the National Historic Preservation Act and/or the Antiquities Code of Texas

*Submission of this form only initiates consultation with the Texas Historical Commission, the State Historic Preservation Officer (SHPO) for Texas. The SHPO may require additional information to complete the review for some projects.*

*FCC projects: this form should not be completed when submitting Form 620 or 621 for communications towers.*

Section 106 of the National Historic Preservation Act of 1966, as amended, requires federal agencies to consider the effects of their undertakings on historic properties and to consult with the State Historic Preservation Officer (SHPO) regarding the undertaking. An undertaking is any action by or on behalf of a federal agency that has the potential to affect historic resources and includes funding, permits, or other approvals. Federal agencies are required to identify historic resources that may be affected and to avoid, minimize, or mitigate any adverse effects. The Section 106 regulations are codified in 36 CFR 800 and are available from the Advisory Council on Historic Preservation website at www.achp.gov. Regulations allow 30 days upon receipt for SHPO review.

The Antiquities Code of Texas (Title 9, Chapter 191 of the Texas Natural Resources Code) is intended to protect historic and archeological landmarks and is applicable to public lands owned by the state of Texas or a political subdivision of the state, including state agencies, counties, cities, school districts, and public colleges and universities, as well as other public authorities. Notification of the Texas Historical Commission is required before breaking ground at a project location on state or local public land.

## 3. Federal Involvement

Does this project involve approval, permit, license, or funding from a federal agency?

☐ Yes (Please complete this section) ☒ No (Skip to next box)

FEDERAL AGENCY

FEDERAL PROGRAM, FUNDING, OR PERMIT TYPE:

FEDERAL AGENCY CONTACT PERSON

PHONE

ADDRESS

EMAIL

Has the federal agency (if other than HUD) formally delegated authority to consult with SHPO on the agency's behalf? ☐ Yes (Please attach delegation letter) ☐ No

## 4. State Involvement

Does this project involve approval, permit, license, or funding from a state agency?

☒ Yes (Please complete this section) ☐ No (Skip to next box)

STATE AGENCY

Texas Commission on Environmental Quality

STATE PROGRAM, FUNDING, OR PERMIT TYPE:

Municipal Solid Waste Disposal Permit #729A

STATE AGENCY CONTACT PERSON

Dr. Richard Carmichael, P.E., Manager, Municipal Solid Waste Permits Section

PHONE

(512) 239-6784

ADDRESS

Municipal Solid Waste Permits Section - MC 124
Building A, Room 122, 12100 Park 35 Circle
Austin, Texas 78753-1808

EMAIL

RCarmich@tceq.state.tx.us

Will this project involve public land owned by the State of Texas or a political subdivision of the state? (State Agency, County, City, School District, Public Authority, Public College or University, etc.)

☒ Yes ☐ No

CURRENT OR FUTURE OWNER OF THE PUBLIC LAND

The City of El Paso currently owns the land permitted for the City of El Paso McCombs Landfill.

## 5. Project Work Description

**Attach** a detailed written description of the project that fully explains what will be constructed, altered, or demolished. Include architectural or engineering plans, site plans, specifications, or NEPA documents, as necessary, to illustrate the project.

## 6. Identification of Project Location and Area of Potential Effect (APE)

The APE includes the entire area within which historic properties could be affected by the project. This includes all areas of construction, demolition, and ground disturbance (direct effects) and the broader surrounding area that might experience visual or other effects from the project (indirect effects).

1. **Attach** map(s) indicating the location and specific boundaries of the project. Road names must be included and legible. Identify the project location, boundaries, and APE on the map(s) as precisely as possible. Suggested maps may include USGS 7.5 minute quadrangle maps (or relevant portions thereof), tax maps, satellite images, etc. The number and types of map(s) will depend on the nature and complexity of the project as well as the extent of the APE. **Projects involving ground disturbance must include the appropriate 7.5 minute USGS quadrangle.**
2. **Attach** a brief written description of the APE, including a discussion of the potential for direct and indirect effects that might result from the project and the justification for the boundaries chosen for the APE.

PROJECT NAME

City of El Paso McCombs Landfill - Texas Historical Commission Review

## 7. Identification of Historic Properties within the APE (Attach additional materials as necessary)

### *A. Archeological Resources*

Does this project involve ground-disturbing activity?

☒ Yes (Please complete this section) ☐ No (Skip to Structures section)

Describe the nature, width, length, and depth of the proposed ground-disturbing activity.

This project involves excavating landfill waste cells to currently permitted depths. The proposed permit amendment does not involve increasing the depth of excavation.

Describe previous land use and disturbances.

The land permitted for the McCombs Landfill has been used for waste disposal activities since the site was permitted in 1984.

Describe the current land use and conditions.

In Texas, the land immediately surrounding and including the McCombs Landfill is predominantly owned by the City of El Paso and is zoned for industrial use or as a ranch or farm district. The land in neighboring New Mexico is predominantly undeveloped and is zoned as a Performance District, used to allow flexibility for land use activities in rural areas.

### *B. Structures*

Are there any structures, buildings, or designed landscape features (park, cemetery, etc.) 45 years old or older within the project area or APE?

☐ Yes ☒ No

Is the project located within or adjacent to a district that is listed in or eligible for the National Register of Historic Places? Eligible districts may include locally designated districts or areas identified in historic resource surveys.

☐ Yes, name of district: ☐ No ☒ Do not know

If the Texas Historic Sites Atlas (http://atlas.thc.state.tx.us) has been consulted, were previously identified architectural resources identified within the project area or APE?

☐ Yes ☒ No ☐ Did not consult Atlas

If the answer to any of the above questions is yes, use the space below or provide an attachment indentifying each structure, building, designed landscape feature, or district within the APE that is 45 years old or older. Include an actual or estimated date of construction and the location of each of the features.

Does the project involve the rehabilitation, alteration, removal, or demolition of any structure, building, designed landscape feature, or district that is 45 years old or older?

☐ Yes ☒ No

If yes, include information with the attachments for Part 5: Project Work Description and Part 8: Photographs.

## 8. Photographs

**Attach** clear, high-resolution color photographs that illustrate the project area and APE as defined in Section 6. Images from the internet are not acceptable due to low resolution. Photography should document the project area and properties within the APE, including clear views of any buildings or structures. Please number and label all photographs, and include a map or site plan labeled to show the location and direction of each view. Where applicable, include photographs of the surrounding area from the project site and streetscape images. Should your project entail the alteration of existing structures, please also provide photographs of the existing conditions of sites, buildings, and exterior and interior areas to be affected.

## 9. Consulting Parties/Public Notification (Section 106 only)

**Attach** a description of the actions taken to notify the public or invite consultation with parties other than SHPO. Provide a summary of any consultation and comments received from consulting parties or the public.

The SHPO is only one consulting party under Section 106. Refer to 36 CFR 800.2 for information about other participants who are entitled to comment on the Section 106 process, including Native American tribes, interested parties, and the public. Consultation with the SHPO is not a substitution for consultation with Native American tribes. When identifying historic resources within the APE and determining the effect of an undertaking, applicants should consider consulting with the county historical commission and the local historic preservation officer, if any.

## 10. Applicant's Determination of Effect (Section 106 only)

An effect occurs when an action alters the characteristics of a property that qualify it for listing in the National Register of Historic Places, including changes to the property's location, design, setting, materials, workmanship, feeling, and association. Effects can be direct or indirect, and can be physical, visual, audible, or economic. They may include a change in ownership or change in use.

- ■ **No Historic Properties Affected** based on 36 CFR 800.4(d)(1). Please provide the basis for this determination.
- ☐ **No Adverse Effect** on historic properties based on 36 CFR 800.5(b). Please explain why the criteria of adverse effect at 36 CFR 800.5(a)(1) were not found to be applicable for your project.
- ☐ **Adverse Effect** on historic properties based on 36 CFR 800.5(d)(2). Please explain why the criteria of adverse effect at 36 CFR 800.5(a)(1) were found to be applicable to your project. You may also wish to include an explanation of how these adverse effects might be avoided, minimized, or mitigated.

In the space below or as an attachment, please explain the effect of the project on historic properties.

No historical properties are directly affected with the implementation of the vertical expansion at the McCombs Landfill due to the fact that no previously-undisturbed earth will be added to the waste footprint.

## 5. Project Work Description

The City of El Paso (City) owns and operates the McCombs Landfill (Landfill) which is managed under Texas Commission on Environmental Quality (TCEQ) Municipal Solid Waste (MSW) permit 729A. The Landfill is located in El Paso County within the El Paso city limits and serves the waste needs of the City and the surrounding area.

In August of 2010, the City voted to implement flow control, a mandate to dispose of all waste generated within the City's jurisdictional area at City facilities. SAIC expects this legislation to increase the throughput to each of the City's landfills by approximately 525,000 Tons Per Year (TPY) in the first year of implementation. The City intends to undergo a vertical expansion of the McCombs Landfill to accommodate the anticipated increase in throughput for the solid waste stream.

The proposed vertical expansion will increase the height of the landfill from the currently permitted elevation of 4,125 feet MSL to 4,305 feet MSL. It is important to note that the proposed expansion will not include any previously undisturbed land as part of the waste footprint. Furthermore, the project involves increasing the above-ground height of the landfill and does not involve deeper excavation of the currently permitted waste cells.

The proposed landfill completion drawings are included as Attachment 2.

## 6. Identification of Project Location and Area of Potential Effect (APE)

A 7.5 minute USGS quadrangle map of the APE is included as Attachment 3. This map has been prepared to meet the standards of 30 TAC §330.61(e) and depicts a 1-mile radius of influence surrounding the Landfill as the Area of Potential Effect (APE). This radius has been chosen for consistency with the Impact on Surrounding Area report that is required by the TCEQ for the Major Permit Amendment effort.

## 8. Photographs

A series of aerial photographs showing the existing conditions of the landfill and the surrounding area are provided in Attachment 4.

## 9. Consulting Parties/Public Notification

Public notification will be required for the McCombs Major Permit Amendment. As per the requirements set forth in 30 TAC §330.69, The City of El Paso will provide notice of the opportunity to request a public meeting and will post notice signs no later than 45 days of the TCEQ executive director's receipt of the application in accordance

with the procedures contained in 30 TAC §39.501. If applicable, notice of a public meeting shall be provided as specified in 30 TAC §39.501(e)(3) and (4).

Furthermore, because the school system closest to the Landfill is required by the Texas Education Code to provide a bilingual program, the City of El Paso will provide public notification in both English and Spanish.

Subject: Review of Conformance to the Regional Solid Waste Management Plan for the McCombs Municipal Landfill
MSW Permit Amendment No. 729A

Dear Ms. Bergren,

As required under the Texas Administrative Code Subchapter E § 330.61(p) the Rio Grande Council of Governments has reviewed the permit amendment application for the McCombs Municipal Landfill. On the 19th of October 2011, the Solid Waste Advisory Committee reviewed the permit amendment application for the McCombs Landfill, MSW Permit Amendment No. 729A. The findings from this review are that the permit application conforms to the Regional Solid Waste Management Plan. The recommendations made by the Solid Waste Advisory Committee were approved by the Rio Grande Council of Governments Board of Directors on the 20th of January 2012.

The Rio Grande Council of Governments has not included a review of land use compatibility conformance. As stated in the Regional Solid Waste Management Plan, this review is left to the communities except on those occasions when the Rio Grande Council of Governments is specifically asked to assist in this evaluation. The City of El Paso has expressed no concerns with the land use compatibility of this facility. The Rio Grande Council of Governments will support the local decision of the community.

Should you require any additional information please contact Korina Navarro, the Environmental Services Coordinator at 915-533-0998, ext. 121.

Sincerely,

Judge Veronica Escobar
President, Board of Directors

Subject: **Solid Waste Conformance Checklist for McCombs Municipal Landfill**

Dear Ms. Navarro:

The City of El Paso (City) is pleased to submit this solid waste conformance checklist and packet for the City's McCombs Municipal Landfill (Landfill). The City, with assistance from SAIC Energy, Environment and Infrastructure, LLC (SAIC), is preparing Major Permit Amendment #729A (MPA) application for submittal to the Texas Commission on Environmental Quality (TCEQ). This submittal contains the information requested on the checklist. The City, and by extension, the Landfill will support and conform to the goals of the Rio Grande Council of Governments (RGCOG). The City will specifically support the goals listed on the conformance checklist (Goals 1 and 3 from the Regional Solid Waste Management Plan (RSWMP)) in the following manner:

- **Goal 1 – Promote planning to ensure adequate services and facilities for the proper management and disposal of municipal solid waste:** The City is open to participating in public/private partnerships to share the cost burden of clean-up events and currently partners with Keep El Paso Beautiful and other non-profit entities on community events by providing roll-off containers, bulk waste pickup, scrap tire disposal, and/or waived or reduced landfill tipping fees.

City Manager
Joyce A. Wilson

- **Goal 3 – Reduce the amount of municipal solid waste disposed of, through waste reduction, recycling, and reuse:** The Landfill has plans in place to divert white goods, tires, yard waste, brush and scrap metal. Additionally, the City will be implementing a mulching program at the landfill to further reduce the net volume of brush disposed at the Landfill. Mulch will with used for City projects and remaining mulch will be offered to the public.

In addition, while RGCOG has not specifically included Goal 2 from the RSWMP as a part of the conformance checklist, this proposed vertical expansion will support this goal to provide technical support and services to promote local and regional municipal solid waste planning. The proposed vertical expansion will support this goal by ensuring long-term disposal capacity in the solid waste system by extending the Landfill's site life by approximately 30 years. The Landfill is an integral part of the regional solid waste system, and currently represents approximately 35 percent of the available disposal capacity for the region, according to the 2010 Annual Reports submitted to the TCEQ.

The City is also providing the requested contact information for the Applicant, the Applicant's Engineer and the TCEQ.

**RIO GRANDE COUNCIL OF GOVERNMENTS**
**SOLID WASTE PLAN CONFORMANCE CHECKLIST**

All applicants seeking a MSW facility permit or registration are required to demonstrate conformance to the Regional Solid Waste Management Plan by the Texas Commission on Environmental Quality (TCEQ). The Texas Administrative Code Subchapter B § 330.61(p) states that the owner or operator shall submit documentation that Parts I and II of the application were submitted for review to the applicable council of governments for compliance with the Regional Solid Waste Plan.

The Solid Waste Advisory Committee (SWAC) will review the application based on the following checklist. These questions will provide the SWAC with information on how the proposed facility will support the goals and objections of the Plan. All questions must be answered entirely in order for the SWAC to review the proposal. Incomplete questionnaires will be returned to applicants. The certification box must be signed by the chief administrative officer of the applicant, indicating that all information provided is accurate and truthful.

---

*Instructions:*

To request a conformance review of a MSW registration or permit application, the following information must be submitted to the Rio Grande Council of Council (RGCOG):

1. Copy of the Application to the TCEQ, Parts I and II.
2. Solid Waste Plan Conformance Checklist (attached)
3. A cover letter with contact information for the applicant, the applicant's engineer and the TCEQ staff person to whom all review-related correspondence should be sent. Contact information should include name, phone number, mailing address, and email address (if available).
4. A map showing the physical location of proposed or existing facility.
5. Any additional information the applicant wishes to provide to facilitate the SWAC review process.

All documents and information should be submitted to the following address:

Environmental Services Coordinator
Rio Grande Council of Governments
1100 N. Stanton, Suite 610
El Paso, TX 79902

**RIO GRANDE COUNCIL OF GOVERNMENTS**
**SOLID WASTE PLAN CONFORMANCE CHECKLIST**

## Section 1: General Applicant Information

1.1 Applicant's Name: McCombs Municipal Landfill

1.2 Location of proposed facility
Nearest City: El Paso, Texas County: El Paso

1.3 ☐ New facility or ☒ Amendment to current permit/registration

1.4 Is this a permit or a registration application?
☒ Permit No.729A ☐ Registration No._____

1.5 What type of MSW facility is being registered or permitted?
☒ Type I Landfill
☐ Type I AE Landfill
☐ Type IV Landfill
☐ Type IV AE Landfill
☐ Type V Facility
☐ Other (please describe)
Describe "Other" below:

1.6 What types of waste(s) will be accepted at your facility?
Municipal Solid Waste, Class II Industrial Waste, Construction and Demolition, Regulated Asbestos Containing Material

1.7 Do you currently or plan to accept special or industrial waste? If so, which classes?
Class II Industrial Waste and Regulated Asbestos Containing Material

1.8 Do you currently or do you plan on accepting treatment plant sludge, treated septage or any other potentially odorous wastes?
Yes, any liquid wastes that are dewatered and will pass the paint filter test can be accepted at the facility. No liquid waste will be accepted.

1.9 What entity or entities in the RGCOG Region is this facility intended to serve?
City of El Paso area; El Paso County, Texas; Doña Ana County, New Mexico

1.10 Does your facility have an operating or host agreement with any RGCOG entity or entities? If so, please provide. If not, do you plan to enter into one?
No operating or host agreement and no intentions to enter into one.

1.11 If the proposed facility is other than a landfill, where will the stored or processed wastes be taken for disposal?
N/A

## Section 2: Regional Goal Conformance

Please provide information as to how your proposed facility will help to support or conform with the goals and objectives of RGCOG's Regional Solid Waste Management Plan.

**Community Clean-Up Events & Illegal Dumping:**

***Goal 1: Promote planning to ensure adequate services and facilities for the proper management and disposal of municipal solid waste.***

2.1.1 Do you plan to participate in any public/private partnerships to share the cost burden of clean-up events?

☐ Yes ☒ No

If yes, please describe:

The City is open to participating in public/private partnerships to share the cost burden, but no partnerships have been established. The City partners with non-profit entities including Keep El Paso Beautiful and Home Owners Associations on community clean-up events.

2.1.2 Do you plan to provide sponsorship for community clean-up events? (e.g., provide roll-off containers at no cost or at significantly reduced costs?)

☒ Yes ☐ No

If yes, please describe:

The City partners with HOAs and Keep El Paso Beautiful on community clean-up events by providing roll-off containers, bulk waste pickup, scrap tire disposal, and/or waived or reduced landfill tipping fees.

2.1.3 What measures do you plan to take to make your facility accessible to the general public? (e.g., operational hours that are public-friendly, extended daytime hours and/or weekend hours, posted fee scales, map availability, public advertising methods, etc.)

The landfill will offer operating hours from 7 am to 4 pm six days a week (Monday – Saturday). Operating hours and landfill tipping fees are posted at the site entrance and on the City's website. Public advertising in the form of press releases is made to inform the public of news events and any changes to the operations.

2.1.4 What plans do you have to help curtail illegal dumping in the vicinity of the proposed facility?

Posted signage outside the landfill informs the public that illegal dumping is a crime and

is not allowed. A security company patrols the landfill as a means of guarding the property and discouraging illegal dumping. Also, a security camera system will be installed to monitor the property and curtail illegal dumping.

2.1.5 As part of your operating plan, will you accept waste from locally sponsored litter and illegal dumping clean-up projects at no cost or at significantly reduced costs?

☒ Yes ☐ No

If yes, please explain:

Yes, the City participates in community clean-up events and accepts waste from locally sponsored cleanups at no cost or at reduced landfill tipping fees.

**Recycling:**

***Goal 3: Reduce the amount of municipal solid waste disposed of, through waste reduction, recycling, and reuse.***

2.2.1 If applicable, how will your facility manage scrap/used tires? Please explain in detail.

Whole used or scrap tires are accepted at the landfill and stored in a dedicated trailer for disposal off-site. Customers entering the landfill are questioned if they are bringing tires for disposal. Tires are placed in the tire trailer, and the tire trailer is transported off-site to the City's contracted Vendor for disposal. A manifest is prepared for each shipment to include the date/time, unit #, generator name & signature, driver name and signature. The tire trailer is weighed prior to leaving the site to document the weight. The manifest is completed at the point of disposal and returned to the landfill.

2.2.2 What are your plans for managing yard waste and brush? Please explain in detail.

The City will be implementing a mulching program at the landfill to help reduce the net volume of brush waste disposed at the landfill. A horizontal grinder will be used to grind the yard and brush waste at the landfill. Brush waste received at the City's Citizen Collection Stations will be transported to the landfill where it will be mulched. Mulch will be used for City projects and any remaining mulch will be offered to the public. A compost pilot project will be implemented to appropriately design the "recipe" and evaluate the market demand of compost.

2.2.3 Will any of the following items be diverted for recycling or reuse?

- ☐ Electronics
- ☒ White Goods
- ☐ Construction/Demolition Debris
- ☒ Tires
- ☒ Yard waste & brush
- ☒ Scrap Metal
- ☐ Other (please describe)

2.2.4 If the proposed facility is other than a landfill, what, if any, type of measures will be taken to minimize, reduce, or recycle the waste before it is hauled off for disposal?

Not applicable. The proposed facility is a landfill.

**Section 3: Certifications**

I hereby certify that the information contained herein is, to the best of my knowledge complete and accurate and that the information in fact represents the MSW facility for which this entity is requesting a TCEQ permit or registration.

Ellen A. Smyth

# Section 3.1
# SITE DEVELOPMENT PLAN NARRATIVE
30 TAC §330.63(a)

A Site Development Plan has been provided as Part III of this MPA application submittal as per the regulations set forth in 30 TAC §330.63. The following Section 3.1 provides a narrative which includes the criteria that, in the selection and design of the facility, will provide for the safeguarding of the health, welfare, and physical property of the people and the environment. This is accomplished through consideration of the site geology and soil conditions, drainage, land use, zoning, and adequacy of access roads and highways.

## 3.1.1 Site History

The Landfill is located approximately 20 miles northeast of downtown El Paso near the intersection of McCombs Road and Stan Roberts (FM 2529). The limits of the facility are approximately defined as McCombs Road to the west, Stan Roberts (FM 2529) to the south, State Highway/County Road 293 to the north, and vacant desert land to the east.

The McCombs Landfill was originally permitted on August 13, 1976 under Permit No. 729 for operation on 25 acres. A permit amendment was issued on May 30, 1984 which increased the total permitted area from 25 acres to 327 acres (327.292 acres in Section 6, Block 80, Township 1, Texas and Pacific Railway Survey, per the site legal description). The facility ceased regular solid waste disposal activities on February 3, 2005 and has only received limited waste since this time from City clean-up projects and storm events. Prior to landfilling operations, the site was owned by Prices Producers, Inc. (Prices). The City of El Paso purchased the property from Prices in September 1954. The site was subsequently leased to El Paso Sand Products to be used for aggregate mining.

Previous landfill activities were confined to approximately 95.2 acres (74.7 acres unlined and 20.5 acres lined (Phase I/II)) of land on the southwest quadrant of the permitted facility as well as existing Sector A (17.4 acres). A paved access road just north of the intersection of McCombs Road and Stan Roberts (FM 2529) provides access to the landfill facility.

## 3.1.2 Permit Amendment Overview

This MPA application develops a vertical expansion of the Landfill from a current maximum height of 4,125 feet MSL to 4,305 feet MSL. This corresponds to an increase in capacity of 47,084,981 CY from a previously permitted volume of 22,348,549 CY to a new permitted volume of 69,433,530 CY. The expansion will apply to all areas of the landfill, including the previously-filled 95.2 acre area in the southwest corner. 64.0-acres will have a piggyback liner, as described in Section 3.4 and portrayed on drawing P3-28B in Appendix 3G, Attachment 4. 11.5 acres will not

receive liner as they are the sideslopes of the expansion area and will not receive any MSW waste. 20.5 acres (currently Subtitle D lined Phase I/II) will continue to be used for MSW disposal (including RACM disposal as described in Section 4.9.22), but at an increased elevation. The additional acreage between the previous southwest area (95.2-acres) and the new total acreage in the southwest area (96.0-acres)is the acreage that previously existed between the unlined and lined areas (Phase I/II).

This vertical expansion will not involve excavation below the previous permitted elevations for the Landfill.

This MPA also increases the property/facility area from 327.292 acres (as described in Section 3.1.1) to 346.74 acres within Section 6, Block 80, Township 1, Texas and Pacific Railway Survey. An updated metes and bounds is provided in Appendix 1C. It should be noted that the increase is only for the property/facility boundary and the permitted waste footprint size is not increasing.

## 3.1.3 Geology and Soil Conditions

A detailed discussion of the geology and soil conditions at the Landfill can be found in Appendix 3K – Geology of this MPA application.

The Landfill is located on deposits of the Hueco Bolson, probably Camp Rice Formation. The Camp Rice Formation unconformably overlies the Fort Hancock Formation and is primarily composed of gravel, sand, silt and occasional discontinuous lenses of volcanic ash. The Camp Rice Formation is composed of two basic subdivisions, a fluvial and a piedmont facies. The fluvial facies is chiefly sand to pebbly river-channel deposits with subordinate fine-grained overbank units. This facies thickens toward the bolson axes and commonly wedges out against the piedmont facies. The permitted landfill area is probably underlain by fluvial deposits of the Camp Rice Formation.

The Hueco Bolson deposits primarily consist of clay, sand, and gravel, with some caliche. The landfill site is underlain by Tertiary and Quaternary basin (bolson) deposits, overlain by areas of gravel and caliche rimrock. Recent Quaternary alluvial deposits are also present in the landfill vicinity in topographically low areas.

In general, the relatively clean sand and silty sand are non-plastic, while clayey sand ranges from low to high plasticity. Permeability tests were not considered necessary based on the soil types encountered during the site characterization. Estimated coefficient of permeability are between 0.01 and 0.04 centimeters per second (cm/sec).

## 3.1.4 Surface Water and Drainage

The complete Facility Surface Water Drainage Report can be found in Section 3.3 of this MPA application submittal.

The stormwater on site is directed away from active portions of the landfill by ditches designed for the 25-year 24-hour storm event. The ditches direct water to the three onsite stormwater retention ponds (A, D, and E). These ponds are designed to hold the 100-year 24-hour storm event as well as contingency storage for sediment.

Four ponds will exist in the final cover condition (A, B, C, and E). Perimeter ditches will be constructed as the intermediate elevations increase above existing grade. These ditches will direct water to the retention ponds where they will retain the 100 year 24-hour event and sediment. The landfill will provide care and management, both during construction and long term, of soil erosion and control of sediment due to surface water.

The care and management of soil erosion and sedimentation is outlined in Appendix 3B – Surface Water Drainage Analysis. The facility will prevent discharge of pollutants to waters of the state. There are no waters of the United States or Corps of Engineers' jurisdictional waters of the state on site therefore no Section 404 permit is required. The McCombs Landfill submitted a notice of intent (NOI) to comply with the TPDES Multi-Sector General Permit relating to stormwater discharge and received Permit No. TXR05L795 from the TCEQ on October 28, 2011. A copy of this permit is included in Appendix 2D – TPDES Multi-Sector General Permit.

## 3.1.5 Land Use and Zoning

A detailed analysis of the land use and zoning of the area immediately surrounding the Landfill is included in Appendix 2B – Land Use Analysis of this MPA application. As described in this analysis, the Landfill is located within the City limits approximately 10 miles northeast of downtown, and lies within 500 feet of the Texas-New Mexico border.

In Texas, the land surrounding the landfill is predominately zoned for light or heavy industrial use, or as a ranch or farm district. From El Paso county plat records and from a visual survey conducted on November 10, 2010, the land immediately surrounding the landfill is primarily owned by the City and is mostly undeveloped.

In New Mexico, the surrounding land use is zoned as a Performance District (PD). According to the Dona Ana County Land Use Regulations and Zoning Ordinance, the purpose of zoning a region as a PD is to allow flexibility for land use activities in the rural areas of the County by acting as a mixed use zone.

No schools, licensed day-care facilities, churches, hospitals, cemeteries, or lakes were identified through visual survey or parcel records within one mile of the Landfill. One man-made pond was identified approximately 1,800-feet east of the facility. The pond is part of the CEMEX quarry area for stormwater control and is dry most of the year. It should also be noted that due to ongoing quarry operations, the size, number, and location of man-made ponds may vary at different times during mining operations.

## 3.1.6 Access Roads and Highways

A traffic impact analysis (TIA) completed by the City of El Paso has been included in Appendix 2C – Traffic Analysis of this MPA application.

The TIA explored the impact of the background traffic growth with the addition of the Landfill traffic to determine the level of mobility (LOM) for McCombs Road, the main access road for the site. As stated in the analysis, McCombs Road between State

## 3.2.1 Facility Access and Site Security

All public access will be controlled to minimize unauthorized traffic, illegal dumping and exposure to hazardous materials. Access to the Landfill will be restricted by existing barbed wire fencing along the perimeter of the facility as well as a locking gate at the facility entrance. These measures will act as deterrents for unauthorized entry during and outside of normal Landfill operating hours. Existing earthen berms along the western and northern boundaries of the Landfill also act as natural deterrents and provide a method of visual screening. The City will install debris netting as needed along the facility boundary.

During times in which the Landfill is accepting waste, access to the Landfill will be restricted to designated Landfill personnel, approved waste haulers, and citizens who have been properly identified by Landfill personnel. Citizens will be directed to a public drop-off area (PDA) and may only be granted access to the working face under the direction of Landfill staff.

## 3.2.2 Waste Movement

As noted in Section 2.2.1, the Landfill will accept MSW as defined by 30 TAC §330.3, inert construction and demolition waste (Class 3 like), and several types of special wastes. Special wastes accepted include Class II industrial waste and municipal commercial waste such as treated medical waste, processed grease/grit trap waste, dead animals, slaughterhouse wastes, and petroleum-product or crude oil contaminated soil. The Landfill also intends to accept RACM. The specific procedures for acceptance, processing and disposal of these wastes are described in Part IV – Site Operating Plan of this MPA application submittal.

Drawing P3-1 shows the general waste movement flow chart for the Landfill. As can be seen from this drawing, all waste will enter the Landfill through the site entrance and will be screened and documented by the scale house attendant. The scale house attendant will be knowledgeable in the types of waste that are accepted and not accepted at the Landfill and will direct each waste hauler to the appropriate area for processing and disposal. Landfill personnel will have the authority to reject any waste that cannot be accepted at the facility. Haulers identified as sources of identified prohibited waste will be responsible for removing the prohibited waste from the Landfill.

In the event that unauthorized waste is not discovered until after the waste hauler has left the Landfill, the waste will be separated and controlled as necessary. Landfill personnel will make an effort to identify the source of the unauthorized waste and have the waste hauler return to the site to remove the waste. If a positive identification cannot be achieved, Landfill personnel will notify the TCEQ and seek guidance on

practical disposal of the waste. A record of the removal of unauthorized waste will be kept in the Site Operating Record.

### 3.2.2.1 Public Drop-Off Area

All residents and some commercial haulers will be directed to the PDA to dispose of wastes in roll-off containers. Trained Landfill personnel will be positioned at the public drop-off area and working face to visually screen for prohibited items.

### 3.2.2.2 Bulky Items Storage

Customers disposing of bulky items and white goods will be directed towards the public drop-off area for unloading (as identified on Drawing P3-17). Acceptable bulky items and white goods include automobiles, metal tanks, large metal pieces, and household appliances that have had all chlorinated fluorocarbons (CFCs) removed in accordance with 40 CFR §82.156(f). These items will be recycled by a permitted salvage company under contract with the City.

## 3.2.3 Sanitation and Water Pollution Control

As described in Section 3.3 – Facility Surface Water Drainage Report, the Landfill will retain all stormwater collected from the property in on-site collection ponds. These ponds are designed to hold the runoff from the facility during the 100-year storm event with 25 percent emergency capacity as well as the volume of silt generated from the drainage area.

Stormwater runoff from the covered waste mass (i.e., not active) will be collected in v-ditches around the perimeter of the landfill. These v-ditches are designed to convey the 25-year storm event for each drainage basin and will direct the stormwater runoff into existing stormwater retention ponds. The retention ponds on site do not have an outlet structure and will drain down via infiltration (or evaporation). Stormwater runoff from the active waste mass will be contained with site run-on/runoff berms as described in Appendix 3I and will be treated as leachate.

Containment areas for the public drop-off area are identified on the Moreno Cardenas Drawing C13 (Appendix 3E). Additionally calculations for storage capacity as well as high water and top elevation for the containment ponds are provided on the drawing.

### 3.2.3.1 Public Drop-Off Area and Bulky Items Storage

Stormwater from the PDA will be conveyed to stormwater retention ponds located in the entrance facility area (Drawing P3-17 in Appendix 3E). Interior roads leading from the entrance of the facility to the grade-separated PDA will be paved using asphalt. The area under the roll-off containers will be paved with concrete. Both the asphalt and the concrete will be sloped to prevent ponding and to encourage the conveyance of water to the stormwater retention ponds.

## 3.2.4 Endangered Species Protection

Correspondence with the Texas Parks and Wildlife Department and the U.S. Fish and Wildlife Service regarding the identification and protection of endangered and threatened species is provided in Section 2.10 and Appendix 2F. Landfill staff will follow the recommendations specified if a species identified is encountered during excavation or filling operations.

This report has been prepared consistent with the requirements of 30 TAC §330.301-330.307. Included in this report are pre-developed, existing, and developed drainage area maps along with erosion control measures and drainage control features. Also provided are hydrologic calculations for pre-developed, existing and developed Landfill conditions. These calculations demonstrate that there is no significant alteration in drainage patterns due to the development of the Landfill. During all phases of construction, the Facility will be constructed, maintained and operated to ensure that run-on and runoff during the 25-year storm event is controlled within the site.

# 3.3.1 Drainage Analysis

## 3.3.1.1 Concepts and Methods

The hydrologic and hydraulic methods employed in this report are consistent with TCEQ regulations. The criterion used is located in the Texas Department of Transportation Bridge Division Hydraulic Design Manual (DOT Drainage Manual). The hydrologic and hydraulic analyses were performed using the Rational Method and Manning's Equation respectively. The Rational Method is based on the maximum flow rate from a drainage area being produced by flows at a given rainfall intensity contributing to the flow at the point of discharge.

The Rational Method equation (in English Units) is as follows:

$Q = CIA$

Where:

Q = Flow rate of Discharge, in cubic feet per second (cfs)

C = Runoff Coefficient, which is unitless

I = Rainfall Intensity, in inches per hour (in/hr)

A = Drainage Area, in acres

The Intensity (I) for a rainstorm is determined from the formula (in English units):

$I = b/[T_c+d)^e]$

Where:

I = Rainfall Intensity, in inches per hour

$T_c$ = Time of Concentration, in minutes (Calculated using the Watershed Lag Method)

e,b,d = Coefficients for specific frequencies, unitless

The runoff coefficient, C, is based on the topography, land cover, and land development of the contributing drainage area. Values of C from the DOT Drainage Manual are shown in Appendix 3B, Attachment 1 – Stormwater Calculations.

The rainfall intensity, I, is based on the time of concentration, $T_c$, in minutes. This is the time it takes the runoff to flow from the furthest point in the drainage area to the point of discharge.

The coefficients used for El Paso County, as obtained from the DOT Drainage Manual are shown in Appendix 3B, Attachment 1 – Stormwater Calculations.

The 24-hr, 25-yr storm event was used for the design of conveyance facilities and the 24-hr, 100-yr storm event was used for the design of ponding facilities and to check overtopping of conveyance facilities.

The volume of runoff for each drainage sub-basin was found using the NRCS Runoff Curve Number Method as discussed in the DOT Drainage Manual.

The NRCS method is expressed by the following equation (in English units):

$S = (1000/CN)-10$

Where:

S = Potential Maximum Retention (inches)

CN = Curve Number

Runoff Depth is determined from the formula (in English units):

$R = [(P-0.2S)^2]/[P+0.8S]$

Where:

R = Runoff Depth (inches)

P = Precipitation (inches)

A curve number of 68 was used for existing conditions, representing range land conditions. The closed Landfill with the rock armoring was given a conservative curve number of 73 for final developed conditions. The precipitation for the design events as discussed in the DOT drainage manual can be seen Appendix 3B, Attachment 1 – Stormwater Calculations.

## 3.3.1.2 Existing Conditions

The McCombs Landfill is an existing municipal solid waste disposal facility located in Section 6, Block 80, Township 1, within the city limits of El Paso, at the intersection of McCombs Road and FM 2529 (Stan Roberts Sr. Road). The site covers 347 acres and the surrounding areas are largely undeveloped. Located west of McCombs Road is the Public Service Board - El Paso Water Utilities' Sludge Monofill.

The soils in the Landfill area are predominantly Turney-Berino Association, moderately deep over soft caliche, in the Hueco Bolson. The soils are characterized as moderately permeable, having high water-holding capacity, and having a slow runoff

rate. Caliche covers the entire Bolson surface and ranges in thicknesses of immeasurable to 8 feet thick.

Pre-Developed drainage patterns and flow rates are shown on Drawing P3-3 – Pre-developed Drainage Conditions, in Appendix 3C. This drawing and drainage discharge values are from the permit dated April 2002, by Moreno Cardenas and remain the same in the Permit Modification dated April 2009 by Parkhill, Smith and Cooper, Inc. (PSC). The existing drainage patterns and flow rates are shown on Drawing P3-4 - Existing Drainage Conditions, in Appendix 3C. It should be noted that the existing drainage patterns have been updated to include the 19.4 acre site facilities drainage area.

Stormwater runoff is collected in a v-ditch around the perimeter of the existing Landfill units and is directed into one of the site stormwater ponds. Runoff generated to the north and east of the existing Landfill is captured in the mined pit area. Some of the runoff in the northwest corner continues to the site of existing Retention Pond A. Runoff generated to the west and south of the existing Landfill area is conveyed into existing Retention Pond D (located west of the existing fee house) and existing Retention Pond E (located in the southeastern corner of the developed Landfill area). Stormwater from the 19.4 acre site entrance facilities area (existing conditions) generally flows to natural low lying areas infiltrates.

Intermediate and long term erosion stability of this site will be dependent upon the implementation of both structural and non-structural best management practices (BMPs) which are also discussed in Appendix 3B – Surface Water Drainage Analysis.

### 3.3.1.3 Developed Conditions

The Final Drainage Conditions plan, provided in Appendix 3C, Drawing P3-6 shows the final developed conditions. The final contours include four ponds to break up drainage areas (the existing Retention Ponds A and E, and Ponds B and C), and in effect reduce sheet flow and minimize erosion. Existing Pond D is no longer needed as that area is filled to grade and flow is conveyed in a v-ditch to Pond E. Also, the final drainage conditions plan for the site entrance facilities area is provided as Drawing C-13 in Appendix 3E. Stormwater from the site entrance facilities area will be contained in one of six onsite detention areas (labeled as DA-1 through DA-6). All runoff from the site will be contained in onsite retention basins.

A total of eight drainage sub-areas are included in the developed drainage conditions plan as shown on Drawing P3-6 - Final Drainage Conditions. Peak flow rates were calculated for each sub-area and are shown on a table within the drawing. Calculations for peak flow rates are included in Appendix 3B, Attachment 1 – Stormwater Calculations.

Stormwater runoff down the side slopes will be captured by a v-ditch, and directed to one of the four ponds. The perimeter drainage system of v-ditches is designed to convey the 25-yr storm event for each drainage basin. All ditches have also been checked to ensure no overtopping occurs in the 100-yr storm event. Calculations for the perimeter ditch designs are provided in Appendix 3B, Attachment 2 – Ditch Calculations. The earthen v-ditches range in depth from 1.71 to 2.26 feet in depth

with 3H:1V side slopes which includes at least 25% depth of freeboard. Velocities in the ditches range from 3.42 to 6.74 feet per second, as shown in Appendix 3B, Attachment 2 – Ditch Calculations. The ditches with velocities exceeding 4.0 feet per second will require erosion protection, according to maximum non-erodible velocities as published in the USDA-SCS Engineering Field Manual, as outlined in a table on the Final Drainage Conditions drawing (Drawing P3-6).

Culverts will be required to convey water from the existing stormwater Retention Pond E to Pond C, as shown on the Final Drainage Conditions drawing. The culverts were sized by Moreno Cardenas using the Heasted Methods Flowmaster program and are provided in Appendix 3B, Attachment 3. The final drainage conditions of the updated closure plan have been evaluated to ensure the culverts sized previously are adequate. The culverts can be seen on the Final Drainage Conditions drawing and the details as provided previously by Moreno Cardenas are provided on Drawings P3-9 and P3-10 in Appendix 3C.

There are two future retention ponds (B and C) and two existing retention ponds (A and E) for the McCombs Landfill final conditions. The ponds are designed to hold the runoff from the 100-yr storm event, 25% emergency capacity, and silt volume (0.012 ac-ft/acre) generated from the drainage area. Pond A is located in the northwest corner of the site within the 100-year floodplain and retains water from drainage areas DEV-2, DEV-3 and DEV-4. See Section 3.3.2 for a discussion of the 100-Year Floodplain area. This area is not regulated under the Section 404 provisions of the Clean Water Act and the Department of the Army permit is not required. A letter from the Department of the Army, date July 2002, is provided in Appendix 3B, Attachment 4. Pond B is located in the northeast corner of the site and retains water from drainage areas DEV-5 and DEV-6, which includes some minimal offsite run-on storm water from just outside the east property boundary. Pond C is located in the southeast corner of the site and retains water from drainage areas DEV-7, DEV-8 and discharge from Pond E, through three 36 inch culverts, which retains water from drainage area DEV-1. The ponds are shown on Drawing P3-6 - Final Drainage Conditions. Calculations for the pond capacities are provided in Appendix 3B, Attachment 1 – Stormwater Calculations. Results of modeling the culverts from the existing pond are provided in Appendix 3B, Attachment 3 – Culvert Calculations.

Developed drainage patterns do not alter the pre-developed and existing conditions in such a way that hinders off-site areas. The perimeter v-ditches and ponding areas will control all runoff generated within the site. The Landfill retains the stormwater onsite as well as accepts some off-site run-on from adjacent properties located to the north, east and south. The off-site run-on is created by visual screening berms that are located approximately 30 feet beyond the property line. All drainage calculations for the facility (both existing and future conditions) include the additional run-on from these off-site areas.

The mined pit area will act as a natural low-lying infiltration basin during interim phases of Landfill operation (applicable to Sectors A through F). The low-lying areas will be graded during Sector construction so that the drainage is away from the developed Sector, preventing run-on. In addition, as each Sector is developed, delineation berms will be placed around the current Sector to prevent runoff from the

working face and run-on from the surrounding features. Retention Ponds B and C will be developed as fill progresses and interim phases are built (Sectors F and D, respectively); Retention Ponds A and E are already constructed. The site retention basins are designed to handle stormwater during all phases of construction (and also for final closure) for any stormwater runoff that leaves the non-active Landfill footprint. The calculations provided for the site retention basins in Appendix 3B, Attachment 6 are for the final closure condition (i.e., the worst case scenario in which the most runoff will be directed to the retention basins); therefore the basins are adequately sized for all phases of Landfill construction. The site drainage collection, conveyance, and detention structures are designed to operate during all phases of Landfill construction so that the existing drainage patterns will not be adversely altered in accordance with 30 TAC §330.305(a). Existing and final stormwater calculations are provided in Appendix 3B, Attachment 6 – Drainage Calculations. Interim structures include delineation (run-on, runoff) berms as identified on Drawing P3-29, Detail 4. Non-erodible velocities and soil loss calculations during all phases of Landfill construction are summarized in Appendix 3B (calculations are provided in Appendix 3B, Attachment 6 and 5, respectively).

### 3.3.1.4 Erosion and Sedimentation Control Plan

The facility has been designed to prevent discharge of pollutants into waters of the State or waters of the United States, as defined by the Texas Water Code and the Federal Clean Water Act. An Erosion and Sedimentation Control Plan is provided in Appendix 3B. The Landfill supervisor is responsible for maintaining drainage structures to ensure proper working order per the Site Operating Plan maintenance requirements. The Landfill submitted a notice of intent (NOI) to comply with the TPDES Multi-Sector General Permit relating to stormwater discharge and received Permit No. TXR05L795 from the TCEQ on October 28, 2011. A copy of this permit is included in Appendix 2D – TPDES Multi-Sector General Permit.

## 3.3.2 Flood Control and Analysis

There is an area of the Landfill, including existing Pond A, to the northwest corner that lies in the 100-year floodplain as shown on the Flood Insurance Rate Map (FIRM) Panel No. 480214 0004 C and Appendix 3D, Drawing P3-14 - 100-Year Floodplain Map. The zone designation for the floodplain is A1, which is an area of 100-year flood with already determined base flood elevations (BFE's) and flood hazard factors. The BFE's were converted from NGVD29 Datum to the City of El Paso Datum with a factor provided by Land-Mark Professional Surveying Incorporated. As shown on Drawing P3-8, the BFE's are below the site berms located around the site, and therefore the 100-year flood will be diverted around the Landfill site to the north and will not affect stormwater elevations within Pond A nor will the BFE's affect Landfill operations. The FIRM map is provided in Appendix 3D, Drawing P3-13.

Pond A was sized as described above with a storage capacity of 19.77 ac-ft. The 100-year 24-hour storm event contributes 17.67 ac-ft of runoff volume (including 25% emergency capacity and silt volume of 0.012 ac-ft/yr). Note from the high-water elevation provided on the cross sections, at least three feet of freeboard is provided in

accordance with 30 TAC §330.307(b)(1). Pond A was sized to contain the volume of runoff plus a 25% emergency capacity and silt accumulations thus minimizing the impact to the BFEs for the area. The floodplain does not come into contact with the Landfill operational areas as described above.

## 3.3.3 Conclusion

The facility has been designed to comply with 30 TAC §330.301 through §330.307.

This waste management unit design plan for the Landfill addresses all weather operation, identifies the method used for landfilling, identifies the deepest excavation, estimates the waste deposition rate, projects site life, provides cross sections of the Landfill, provides a liner quality control plan, and provides a final cover quality control plan.

# 3.4.1 Landfill Unit Design

## 3.4.1.1 Provisions for All-Weather Operation

30 TAC §330.63(d)(4)(A)

Precautions will be taken to ensure all roads are passable during all weather conditions. New all-weather roads will be constructed as fill progresses in each area of the Landfill. The roads will consist of a compacted layer on the road surface to minimize mud tracking and allow access during all weather conditions. The main access road to the site will be constructed with a top layer of flexible pavement.

## 3.4.1.2 Proposed Landfill Method

30 TAC §330.63(d)(4)(B)

The McCombs Landfill has broken up development into eleven sectors. These sectors are identified as A through K. Drawings depicting this layout, existing site conditions, final fill height, drainage structures, and entrance facilities are provided in Appendix 3E - Site Layout Plans. Area filling will take place in each sector before moving onto the next. The settlement rate will be affected by the method of landfilling, the amount of moisture in the refuse, and by the amount of compaction received. Poor compaction and high lifts would result in more settlement. Decomposition is anticipated to be slow due to the low amount of precipitation received on average in the area. An in-place density of 1,200 pounds per cubic yard (lb/cy) or greater will reduce the amount of settlement.

Excavation side slopes and final side slopes will be no steeper than 3H:1V, and the final top slope will be approximately 7%. Placement of final cover will generally follow the same sequence of development, sector A through K. Closure of each sector will be in accordance with the closure plan provided in Section 3.8 – Final Closure Plan.

## 3.4.1.3 Elevation of Deepest Excavation

30 TAC §330.63(d)(4)(C)

The deepest elevation of excavation will be approximately 4017 feet above mean sea level (msl) in the leachate collection sumps. The minimum waste placement elevation will be approximately 4024 above msl (minimum base elevation of 4022 plus two-feet for protective sand layer). The maximum elevation of final cover will be 4305 feet above msl. The maximum elevation for disposed waste will be 4301.7 feet above msl (for the alternative cover profile). All elevations listed are in City of El Paso vertical datum.

## 3.4.1.4 Estimated Waste Deposition Rate and Site Life

30 TAC §330.63(d)(4)(D)

The estimated rate of disposal was calculated assuming an annual population increase of 2% in growth, and assuming a disposal rate of 497,309 tons per year (in 2014 tonnage) until Clint Landfill closes in 2030. 3,000 tons per year are assumed from 2011 through 2013. After Clint Landfill closes, McCombs Landfill will receive all of the waste that would have previously been received at the Clint Landfill, therefore the disposal rate at McCombs will raise from 45% of the county waste allocation to 100%. The 1990 base population for central, northeastern and northwestern areas of El Paso (areas where solid waste is planned to go to the McCombs Landfill) was used for the growth rate estimation. The population for the above mentioned areas in 1990 was 322,842 people. Using the rate above, and an airspace utilization factor of 1200 lb/cy, the estimated life of the Landfill is to 2059.

The total remaining Landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including waste and daily, intermediate and final cover), which provides capacity through 2014, based on table 3.4H-1 in Appendix 3H - Site Life Projections. The total remaining Landfill volume available for waste disposal including the remainder of Sector A and all subsequent planned sectors (B through K) is 63,469,470 CY, which provides a site life until 2059 or 2060, depending on final cover. Calculations and assumptions for this waste volume and site life are included in Appendix 3H - Site Life Projections.

## 3.4.1.5 Landfill Cross-Sections

30 TAC §330.63(d)(4)(E)and(F)

Cross sections of the Landfill are located in Appendix 3F as drawings P3-19 through P3-24. These sections show the existing ground elevations; anticipated base elevation of excavation; bottom, side slope and vertical fill elevations; permitted fill elevations; existing groundwater monitoring wells; and the liner and cover system elevations. Top of waste elevation; perimeter or toe berm details; gas vents or wells; and groundwater elevations are included by reference to other portions of the permit document. The sections shown are representative of the entire site.

## 3.4.1.6 Liner Quality Control Plan

30 TAC §330.63(d)(4)(G)

A quality control plan for the base composite liner system in accordance with §330.339 is provided in Appendix 3J - Liner Quality Control Plan. The components of the current alternative liner system (Scenario 1) are listed from top to bottom in Table 3.4-1 and components of the proposed alternative liner system (Scenario 2) are listed from top to bottom in Table 3.4-2. It should be noted that the modeling results for both Scenario 1 and Scenario 2 are provided in Appendix 3J.

Table 3.4-1
Components of the Scenario 1 Liner System in Descending Order

| Liner System Component | Description | Thickness |
|---|---|---|
| Protective Cover | Sand with coefficient of permeability greater than or equal to $1x10^{-3}$ cm/sec | 24 inches |
| Geomembrane Liner | Textured HDPE Geomembrane (permeability less than or equal to $2x10^{-13}$ cm/sec) | 60 mil |
| Compacted Soil Liner | Compacted Caliche with a coefficient of permeability less than or equal to $1x10^{-7}$ cm/sec | 6 inches |
| Compacted Soil Liner | Compacted Native Soil or Interim Cover Soil | 6 inches |

Table 3.4-2
Components of the Scenario 2 Liner System in Descending Order

| Liner System Component | Description | Thickness |
|---|---|---|
| Protective Cover | Sand with coefficient of permeability greater than or equal to $1x10^{-3}$ cm/sec | 24 inches |
| Geomembrane Liner | Textured HDPE Geomembrane (permeability less than or equal to $2x10^{-13}$ cm/sec) | 60 mil |
| Geosynthetic Clay Liner | Geosynthetic Clay Liner (GCL) with a coefficient of permeability less than or equal to $5x10^{-9}$ cm/sec | Approx. 0.24 inches |
| Compacted Soil Liner | Compacted Native Soil or Interim Cover Soil | 6 inches |

Section 1.1.2 discusses a liner system where select C&D material will be placed over the existing unlined landfill (referred to as Scenario 3). The existing unlined landfill grade has a varying slope. In order to attain the minimum designed leachate collection slope of 5% to collect and convey leachate to the centrally located leachate collection piping within Sector J, the area over the unlined landfill will be required to be filled.

The design for Scenario 3 includes a 30-foot thick layer of select C&D material (a list of select material is included in Section 2.2.1) to be placed over the existing unlined landfill, overlain by up to 25 feet of uncontaminated fill soil. Drawing P3-26 depicts the maximum C&D fill elevation over the unlined landfill area. A comparison of the existing grade and anticipated C&D and soil fill elevations are shown in Drawing P3-26B. The blue contours shown on this drawing represent "fill" and the green contours represent no fill (i.e. zero feet). The design for the liner base grades are governed by the low area on the east portion of Sectors H and J, and the base grades are designed with a minimum 5% slope. Drawing P3-26C depicts the C&D and soil fill profile over the unlined landfill, showing the leachate collection trench within the east area of Sector J to the west area of Sector J, and the north-south cross section through the leachate collection area in Sector J.

In addition to attain the designed liner base grades to facilitate leachate collection and conveyance, the C&D and soil fill material will also provide surcharging of the underlying waste material, improving the settlement and strength properties of the unlined landfill to provide a more stable area to build the piggyback liner system.

The components for the expansion piggyback liner (Scenario 3) onto the existing unlined MSW area are listed from top to bottom in Table 3.4-3. The expansion piggyback liner will be placed in Sectors H, I, and J (approximately 64 acres, see Drawing P3-28B in Appendix 3G, Attachment 4). Detail drawings of the liner system are located in Appendix 3G - Construction Design Details, Drawing P3-28 – Landfill Base Plan.

Table 3.4-3
Components of the Scenario 3 Liner System in Descending Order

| Liner System Component | Description | Thickness |
|---|---|---|
| Protective Cover | Sand with coefficient of permeability greater than or equal to $1x10^{-3}$ cm/sec | 24 inches |
| Geomembrane Liner | Textured HDPE Geomembrane (permeability less than or equal to $2x10^{-13}$ cm/sec) | 60 mil |
| Geosynthetic Clay Liner | Geosynthetic Clay Liner (GCL) with a coefficient of permeability less than or equal to $5x10^{-9}$ cm/sec | Approx. 0.24 inches |
| Geogrid Stabilization Layer | Uniaxial Layers Placed Perpendicular to One Another | 2 layers |
| Interim Cover Soil | Sand with coefficient of permeability greater than or equal to $1x10^{-3}$ cm/sec | 6 inches |
| Compacted Buffer Soil | On Site Soil | 36 inches |

## 3.4.1.7 Final Cover Quality Control Plan

30 TAC §330.457

A quality control plan for the final cover system is included in Appendix 3O. Detail drawings of the final cover system are provided in Appendix 3G, Drawing P3-33 - Final Cover Plan, and Drawing P3-34 – Final Cover Details. The components of the prescriptive final cover system for lined areas of the Landfill are listed from top to bottom in Table 3.4-4 below. The components of the prescriptive final cover system for unlined areas of the Landfill are listed from top to bottom in Table 3.4-5. The components of the alternative final cover system (for both lined and unlined Landfill areas) are listed from top to bottom in Table 3.4-6.

Table 3.4-4
Components of the Prescriptive Final Cover System in Descending Order (Lined Landfill)

| Cover System Component | Description | Thickness |
|---|---|---|
| Topsoil Layer | Native Topsoil or Rock Armoring | 6 inches topsoil or 4 inches rock |
| Erosion Layer | Earthen Material | 12 inches |
| Flexible Membrane Cover | Textured LLDPE or VLPE Liner | 40 mil |
| Infiltration Layer | Sand with a permeability less than or equal to $1x10^{-5}$ cm/sec | 18 inches |
| Intermediate/Daily Cover | Native Soil | 12 inches |

Table 3.4-5
Components of the Prescriptive Final Cover System in Descending Order (Unlined Landfill)

| Cover System Component | Description | Thickness |
|---|---|---|
| Topsoil Layer | Native Topsoil or Rock Armoring | 6 inches topsoil or 4 inches rock |
| Erosion Layer | Soil with a coefficient of permeability less than or equal to $1x10^{-5}$ cm/sec | 18 inches |
| Intermediate/Daily Cover | Native Soil | 12 inches |

Table 3.4-6
Components of the Alternative Final Cover System in Descending Order

| Cover System Component | Description | Thickness |
|---|---|---|
| Top Layer | Rock Armoring | 4 inches |
| Erosion Layer | Material placed at 90% compaction | 18 inches |
| Support Layer | Material placed at 80% compaction | 6 inches |
| Intermediate/Daily Cover | Native Soil | 12 inches |

## 3.4.2 Storage and Transfer Units

### 3.4.2.1 Citizen's Collection Area

All residents and some commercial haulers will be directed to the PDA to dispose of wastes in roll-off containers. Trained Landfill personnel will be positioned at the public drop-off area and working face to visually screen for prohibited items. Customers disposing of bulky items and white goods will also be directed towards the PDA for unloading. Acceptable bulky items and white goods include automobiles, metal tanks, large metal pieces, and household appliances that have had all chlorinated fluorocarbons (CFCs) removed in accordance with 40 CFR §82.156(f). These items will be recycled by a permitted salvage company under contract with the City.

The geologic data submitted to the TCEQ as part of the 2002 MPA has been reviewed and approved by George Richardson, Professional Geologist in the State of Texas. The geologic data, including the boring logs and cross sections, are located in Appendix 3K – Geology.

An updated Site Characteristics and Monitoring Plan has been developed by Parkhill, Smith and Cooper to conform with the requirements of 30 TAC §330.63(e) (Appendix 3K, Attachment 1).

The information provided within the Geology Report and supporting documents in Appendix 3K generally conforms with the requirements of 30 TAC §330.63(e). This permit amendment includes a request for a vertical expansion of the Landfill but no lateral expansion of the Landfill footprint. Prior to starting work on this permit amendment and during the subsequent permit review and comment period, TCEQ stated, since there is no lateral expansion of the Landfill no additional geologic site characterization is necessary.

# Section 3.6
# GROUNDWATER SAMPLING AND ANALYSIS PLAN
30 TAC §330.63(f)

A Groundwater Sampling and Analysis Plan prepared by Parkhill, Smith and Cooper (PSC) in 2009 has been provided in Appendix 3L – Groundwater Sampling and Analysis. This plan was prepared in accordance with the standards set forth in 30 TAC §330.63(f).

# 3.7.1 Introduction

This landfill gas (LFG) management plan (Plan) has been developed as required by 30 TAC §330.63(g) for the Landfill located in El Paso, Texas. This LFG management plan is consistent with the requirements set forth in 30 TAC §330.371 and provides a site-specific approach for completing LFG management. This Plan describes the existing and potential future LFG management system and discusses the operation and monitoring of these systems, including verification of results, notification procedures, and possible remediation activities. Landfill Gas Management Plans developed by R.W. Beck, dated April 3, 2009, VIVA Environmental, Inc, dated November 27, 2001, and AGRA Earth and Environmental Group, dated April 8, 1994, were used in the development of the following section and are included for reference as Appendix 3M, Attachment 4.

## 3.7.1.1 Purpose

Compliance with §330.371(a) requires landfills to implement a routine LFG monitoring program to ensure that the following conditions are met:

- Concentrations of methane gas does not exceed 1.25% by volume in facility structures (excluding gas control or recovery system components); and
- Concentrations of methane gas does not exceed 5% by volume in monitoring points, probes, or other matrices at the facility boundary.

The purpose of this plan is to provide guidelines for the management of LFG and to provide guidance if the levels of methane exceed the limits specified above. Pursuant to §330.371(c), if methane levels are exceeded, the owner or operator shall take the following steps:

- Ensure protection of human health, and notify the Executive Director, local and county officials, emergency officials, and the public of the exceedance;
- Within seven days of the detection, operating records shall be updated to reflect the concentration of methane gas levels detected and the steps that were taken to protect human health; and
- Within 60 days of exceedance, a remediation plan shall be implemented to control methane gas releases. Copies of the remediation plan shall be placed in the operating record, provided to the Executive Director, and notification to the Executive Director that the plan has been implemented. The remediation plan shall include the nature and extent of the problem and the proposed remedy. After review, the Executive Director may require additional remediation measures.

### 3.7.1.2 General

In accordance with §330.371(d), the Executive Director may establish alternative schedules for demonstrating compliance with subsections §330.371(b) and §330.371(c).

In accordance with §330.371(e), the LFG monitoring and control program will continue for a period of 30 years after certification of final closure of the facility or until the owner or operator receives written authorization to reduce the program. Authorization to reduce LFG monitoring and control shall be based on demonstration that there is not potential for gas migration beyond the property boundary or into site structures. Demonstration shall be supported by collected data and additional studies, as required.

In accordance with §330.371(f), the LFG monitoring and control system shall be revised as needed to maintain current and effective LFG monitoring and control. Post-closure shall not interfere with the function of the LFG monitoring and control systems. Any underground utility trenches that cross the facility boundary shall be vented and monitored regularly.

## 3.7.2 Site Characteristics

In accordance with §330.371(b), the Landfill shall implement a routine LFG monitoring program to ensure the standards of §330.371(a) are met. The type and frequency of monitoring shall be based on the existing site conditions. The minimum frequency of monitoring shall be quarterly.

### 3.7.2.1 Soil Conditions

The site geologic conditions present at the Landfill are discussed in Appendix 3K - Geology.

### 3.7.2.2 Hydrogeologic Conditions

The hydrogeologic conditions present at the Landfill are discussed in Appendix 3K – Geology.

### 3.7.2.3 Hydraulic Conditions

Hydraulic conditions at the Landfill are discussed in Section 3.3 – Facility Surface Water Drainage Report.

### 3.7.2.4 Facility Structures within the Property Boundary

The Landfill has a permit boundary of approximately 347-acres. The existing structures located within the property boundary include the existing gatehouse (fee collection building), the maintenance building and a small storage building. The scale house building shall be monitored quarterly with a hand held gas meter at the base of each exterior wall and ambient air. As part of the facility expansion, it is anticipated

that a new equipment maintenance building and scale house will be constructed to the south of the existing buildings within the property boundary (Drawing P3-17 in Appendix 3E). Any new Landfill structures will be monitored similarly to the existing structures.

### 3.7.2.5 Underground Utilities

Underground utility lines that exist within the future disposal footprint of the landfill will be removed prior to the landfill expansion. No utility lines exist within the current disposal footprint of the landfill. Overhead lines provide electricity and telephone service to the buildings on-site. Consequently, monitoring or reporting of easement for buried utilities is not applicable.

### 3.7.2.6 Offsite Structures

In accordance with §330.371(h), since off-site habitable structures are located within 3,000 feet of the waste placement boundary, a permanent perimeter monitoring system is installed at the Landfill and is discussed in more detail below.

## 3.7.3 Existing Monitoring System

The existing LFG systems consists of gas monitoring probes (GMP) located along the perimeter of the landfill property as well as a landfill gas migration control system (GMCS) located along the western perimeter of the Landfill. The existing systems are shown on Drawing P3-43 in Appendix 3M and are described in further detail below.

### 3.7.3.1 Gas Monitoring Probes

GMP-1 through GMP-8 were installed in 1994. Description of the installation practices and sample boring and well installation logs are provide in the Landfill Gas Management Plan prepared by AGRA Earth & Environmental Group (AGRA) on April 8, 1994.

GMP-9 through GMP-17 were installed in 2001 by VIVA Environmental, Inc. (VIVA). Description of the installation practices, boring logs and well installation logs are provide in the Landfill Gas Management Plan prepared by VIVA on November 27, 2001.

In 2003, GMP-3 was replaced with GMP-3A and GMP-3 was decommissioned, plugged and abandoned. GMP-3A was installed adjacent to GMP-3 at a depth of approximately 67 feet below ground surface (bgs). The City also decommissioned, plugged and abandoned GMP-4, GMP-5, and GMP-6 based on previous TCEQ approval due to the GMPs no longer falling on the outside perimeter of the landfill. The GMPs were abandoned in November 2003.

In 2004, GMP-18 and GMP-19 were installed to eventually replace GMP-2 and GMP-3A, respectively. The current locations of GMP-2 and GMP-3A are too close to the waste limits, and the locations of GMP-18 and GMP-19 are more suitable for gas monitoring at these two locations. GMP-2 and GMP-3A readings have returned to

compliance due to the installation and operation of the active GMCS along a portion of the western perimeter as part of the gas migration remediation plan, but the GMPs have yet to be decommissioned, plugged and abandoned.

Temporary gas monitoring probes GMP-20, GMP-21, and GMP-22 were installed in 2006 to provide additional information on gas migration. Readings taken from the temporary probes have demonstrated that the gas migration issue has been mitigated. These probes are to be decommissioned, plugged and abandoned at a future date.

Boring and well installation logs for GMP-18 through GMP-22 are provided in the Landfill Gas Management Plan prepared by R.W. Beck in 2009.

The permanent Site Methane Monitoring Network currently consists of fourteen (14) GMPs (GMP-1 and GMP-7 through GMP-19) spaced approximately 1,000 feet apart. The GMPs were installed along the permitted area and property boundary. A review of on-site geological/soil data revealed little evidence of any laterally extensive stratographic units which could significantly influence migration of any gases produced within the landfill cells (AGRA, 1994). Additionally, geomembrane liner systems that will exist in future landfill cells should minimize potential for LFG migration away from the landfill footprint.

### 3.7.3.2 Passive Gas Vents

In June 2000, two passive venting wells (PV-1 and PV-2) were installed in order to intercept and vent methane gas prior to reaching GMP-2 and GMP-3. Both venting wells were installed to a depth of approximately 60-feet bgs in order to capture methane gas at depths where the majority of the elevated methane gas levels were detected and may be generated. In 2001, one vertical passive venting well (PV-3) was installed to a depth of 55-feet below grade.

In November of 2003, PV-1A and PV-2A were constructed to help mitigate the high methane readings recorded in GMP-2 and GMP-3. PV-1, PV-1A and PV-2A still exist within in the LFG management system; however, these wells were capped during the installation of the GMCS.

Five additional passive gas vents were installed in 2006 to provide additional gas venting in the area between GMP-2 and GMP-3. PV-3R was a replacement vent of PV-3 installed in 2001. PV-3 was abandoned in November 2003 as it falls within the landfill footprint and was no longer required to reduce methane levels measured at GMP-4.

PV-2 through PV-7 were converted into active gas extraction wells as part of the GMCS construction. The GMCS system is described in more detail in Section 3.7.3.3 below.

It should be noted that existing PVs (capped and active) will likely be decommissioned, plugged and abandoned prior to the vertical expansion on top of the existing landfill, assuming that this section of the existing landfill is no longer producing significant amounts of LFG at that time. However, in the event that the PVs still contain a significant amount of LFG, the PVs will be piped horizontally to

the landfill perimeter for LFG venting/collection. PVs will not be extended vertically through the future expansion landfill geomembrane liner.

The locations of all active and abandoned GMPs and PVs are shown on Drawing P3-42 in Appendix 3M. Table 3.7-1 provides the approximate coordinates, elevations, and installed depths below ground surface at the time of installation of the GMPs and PVs of the existing system.

Table 3.7-1
Existing LFG Monitoring System Monitoring Points

| Reference Point | Date Installed | Northing[1] | Easting[1] | Depth Below Ground Surface | Ground Elevation |
|---|---|---|---|---|---|
| GMP-1 | 1994 | 10738395.3 | 413850.0 | 55-feet | 4086.41[2] |
| GMP-2 | 1994 | 10739603.6 | 413889.0 | 55-feet | 4088.11[2] |
| GMP-3 | 1994 | | Abandoned | | |
| GMP-3A | 2003 | 10740576.6 | 413938.6 | 55-feet | 4096.68[2] |
| GMP-4 | 1994 | | Abandoned | | |
| GMP-5 | 1994 | | Abandoned | | |
| GMP-6 | 1994 | | Abandoned | | |
| GMP-7 | 1994 | 10738660.9 | 415896.4 | 10-feet | 4072.61[2] |
| GMP-8 | 1994 | 10738332.2 | 414822.2 | 55-feet | 4072.38[2] |
| GMP-9 | 2001 | 10738234.7 | 416875.7 | 55-feet | 4078.55[2] |
| GMP-10 | 2001 | 10739228.3 | 417042.1 | 55-feet | 4084.32[2] |
| GMP-11 | 2001 | 10740226.8 | 417080.2 | 55-feet | 4087.33[2] |
| GMP-12 | 2001 | 10741225.2 | 417116.3 | 55-feet | 4082.85[2] |
| GMP-13 | 2001 | 10742226.1 | 417153.5 | 55-feet | 4082.21[2] |
| GMP-14 | 2001 | 10742561.4 | 416214.0 | 55-feet | 4075.69[2] |
| GMP-15 | 2001 | 10742613.3 | 415216.7 | 55-feet | 4067.69[2] |
| GMP-16 | 2001 | 10742664.4 | 414138.6 | 55-feet | 4048.13[2] |
| GMP-17 | 2001 | 10741690.8 | 413989.8 | 55-feet | 4056.37[2] |
| GMP-18 | 2004 | 10739597.9 | 413835.6 | 65-feet | 4086.00[1] |

[2] Elevations obtained from VIVA, 2001.

### 3.7.3.3 Gas Migration Control System (Western Perimeter)

Existing gas monitoring probes (GMP-2, GMP-3, GMP-20, and GMP-21) located along the western perimeter of the Landfill have had periodic elevated methane readings above the regulatory limit of 5%. The Landfill was placed under enforcement action by the TCEQ to mitigate the affected GMPs due to the elevated methane readings.

In an attempt to reduce the methane readings, PV-1A and PV-2A were installed in 2003 and PV-3R through PV-7 were installed in 2006 along the western waste limit of the Landfill; however, the passive vents installed were not effective in controlling gas migration toward the affected GMPs. As a result, the City decided to install an active gas migration control system (GMCS) as part of the site gas remediation plan.

The GMCS is an active extraction system to control LFG migration in the affected area. The system is a partial active system, because it was installed only along a distance of approximately 1,000 feet over the northwestern portion of the unlined landfill. Existing PV-2 through PV-7 were converted into active gas extraction wells as part of the GMCS. In addition to the 6 converted extraction wells, the GMCS consists of LFG header and lateral pipes, a condensate sump and pump system, a blower/flare station, a condensate storage tank, and an air compressor system to power the condensate pump system. Since the GMCS system installation and subsequent start up in August of 2009, the GMP readings have been in compliance. If there are methane readings out of compliance in the future, further investigation will be conducted to ensure that the existing system is performing optimally. In the case that the system is running at peak performance and methane readings are still out of compliance, additional PVs may be added to the GMCS network. GMCS details are provided in the R.W. Beck Landfill Gas Management Plan of 2009.

## 3.7.4 Potential Future LFG Management System

### 3.7.4.1 NSPS Requirements

Pursuant to 40 CFR Part 60, Subpart Cc §60.33c, "a State plan shall include control of MSW landfill emissions at each MSW landfill meeting the following three conditions:

1. The landfill has accepted waste at any time since November 8, 1987, or has additional design capacity available for future waste deposition;
2. The landfill has a design capacity greater than or equal to 2.5 million megagrams and 2.5 million cubic meters. The landfill may calculate design capacity in either megagrams or cubic meters for comparison with the exemption values. Any density conversions shall be documented and submitted with the design capacity report; and,
3. The landfill has a nonmethane organic compound emission rate of 50 megagrams per year or more."

### Design Capacity

One threshold for NSPS requirements is the Landfill having a design capacity of 2.5 million megagrams (Mg) or cubic meters. The Landfill design capacity is over the NSPS threshold of 2.5 million Mg.

### NMOCs

Because the Landfill is over the design capacity threshold, nonmethane organic compound (NMOC) monitoring is required at a Tier II level. The last NMOC monitoring event conducted at the Landfill was completed in March 2007. The results from the NMOC monitoring indicate that the maximum NMOC concentration will occur in year 2047 at a concentration of 34.69 Mg (under the 50 Mg threshold). According to the 2007 test results, the Landfill is currently under the annual air emissions threshold of the Federal New Source Performance Standards (NSPS), and as a result, there is no present requirement for the City to install a LFG collection and control system (GCCS) covering the entire landfill. The latest NMOC results are provided in Appendix 3M.

NMOC monitoring will continue, as necessary, in accordance with the site air permit and the Landfill will continue to evaluate the need for an active GCCS based on future NMOC monitoring results.

## 3.7.4.2 Active Gas Collection and Control System

Although the Landfill is currently not required to install an active GCCS system, the following system has been designed with the assumption that the Landfill will either eventually have to comply with NSPS standards, or will choose to install an active GCCS voluntarily to further landfill gas to energy efforts.

The designed active GCCS will consist of a series of wells and piping used to convey LFG to an open flare station for combustion or to a landfill-gas-to-energy conversion system. The GCCS will be constructed in a similar manner to the GMCS and may include some of the same components as the GMCS. GCCS components will include:

- Header/Manifold
- Lateral
- Vertical Gas Wells (GW)
- Cleanout Stations
- Condensate Sumps
- Flare Station

As shown on Drawing P3-39 in Appendix 3M, the GWs were designed at a radius of influence (ROI) of 150-feet. The ROI was developed based on previous experience with similar type soils (silty sand/sandy) and drier waste moisture content. The actual location of the GWs may vary dependent on site conditions at the time of installation.

### 3.7.4.3 Existing System Modifications

Upon Landfill expansion, it is anticipated that GMP-7 will be removed from the monitoring system and that GMP-23 will replace GMP-7 in the monitoring network (Drawing P3-43 in Appendix 3M). GMP-23 will be located on the outside of the Landfill limits, but inside the property boundary. GMP-7 will be decommissioned, plugged and abandoned upon installation of GMP-23. GMP-23 will be installed following the guidelines set forth in Section 4.2 of the AGRA Landfill Gas Monitoring Plan, 1994 (Appendix 3M, Attachment 4).

## 3.7.5 Monitoring Plan

### 3.7.5.1 Perimeter Monitoring

#### Perimeter Monitoring Network

The LFG monitoring probe network at the Landfill includes a total of fourteen existing LFG monitoring probes (GMP-1 and GMP-7 through GMP-19) located along the perimeter of the waste fill area. Locations of the existing GMPs are shown on Drawing P3-43 in Appendix 3M. As mentioned previously, GMP-7 will be replaced with GMP-23 in the permanent monitoring network.

#### Landfill Gas Monitoring Probes

LFG monitoring probes have been installed along the perimeter of the waste fill area. Boring logs and typical construction details for the GMPs have been provided in previous versions of the LFG Management Plan (R.W. Beck 2009, VIVA 2001, AGRA 1994) which are provided in Appendix 3M, Attachment 4. Future LFG monitoring probes will be installed in accordance with the detail shown on Drawing P3-44 in Appendix 3M.

#### Monitoring Procedures

During each monitoring event, the GMPs will be monitored for the following parameters:

- Probe gas pressure at each probe;
- Methane gas concentrations at each probe;
- Barometric pressure during the monitoring event; and
- Ambient temperature during the monitoring event.

Monitoring for gas composition and pressure will be performed using a portable combustible gas indicator capable of measuring the above parameters. Prior to the start of monitoring, the tester shall calibrate monitoring instruments in accordance with the manufacturer's specifications. The instrument is factory calibrated semi-annually. The tester should also record time, temperature, barometric pressure, and weather conditions prior to the start of the monitoring period. Each GMP shall be monitored using the following monitoring procedures:

- Check GMP's integrity;
- Determine pressure within sealed monitoring tube;
- Determine methane concentrations at each location; and
- Record all data on the LFG Monitoring Report Form (Appendix 3M).

### Maintenance Procedures

Each time LFG monitoring is conducted, the sampler will inspect the integrity of the LFG monitoring probes. The sampler will record pertinent information on the LFG Monitoring Report Form provided in Appendix 3M. The LFG Monitoring Report Form will be kept in the Site Operating Record. The sampler will perform the following at each monitoring event:

- Verify that the GMP identification number is clearly labeled on the outer casing or lid;
- Verify that the protective casing is intact and is not bent or excessively corroded;
- Verify that the protective barrier pipes are intact;
- Verify that the working pad is intact;
- Verify that the lock is functional;
- Verify that the hinged cover is in working order; and
- Verify that the inner casing is intact.

If damage or excessive wear to the LFG monitoring probe is observed, it will be reported to the landfill manager and repaired within 30 days of the date damage is observed. If it is not possible to repair the GMP, the LFG monitoring probe will be decommissioned and replaced within 60 days from the TCEQ approval date of the permit modification requesting replacement of the GMP. Upon completion of the replacement GMP, an as-built documentation report including boring and well installation logs will be submitted to the TCEQ.

The combustible gas monitoring instrument will be calibrated and maintained in accordance with the manufacturer's instructions.

## 3.7.5.2 GMCS/GCCS Monitoring

### GMCS Monitoring Network

The gas migration control system network currently consists of 6 active gas wells that were converted from passive gas vents (PV-2 to PV-7). The system was installed to mitigate methane exceedance detected in GMP-2, GMP-3, GMP-20 and GMP-21 along the western perimeter of the unlined landfill area. In the event that the levels of methane increase above regulatory standards in the affected GMPs, expansion of the existing GMCS may occur. It is anticipated that this system will eventually be replaced by the GCCS network.

### GCCS Monitoring Network

The GCCS is anticipated to be installed either upon the landfill reaching NSPS standards requirements or on a voluntary basis. This is dependent both on the current permitted waste capacity (which the landfill is currently exceeding the limits of 2.5 million megagrams or 2.5 million cubic meters) and the current NMOC concentration within the LFG. As described in Section 3.7.4.1, the actual timing for the Landfill reaching NSPS standards is currently unknown and will be dependent on future NMOC monitoring.

### Monitoring Procedures

The GMCS and GCCS are designed to collect LFG and prevent fugitive emissions from the Landfill. Since the rate of LFG production within the landfill varies, the amount of gas withdrawn by the GMCS/GCCS GWs should also be adjusted. During each monitoring event, the Flare (and/or potential gas-to-energy conversion system) will be monitored and the GWs will likely be monitored for the following parameters:

- Gas flow at each location;
- Gas pressure at each location;
- Gas temperature at each location;
- Methane gas concentrations at each location;
- Oxygen gas concentrations at each location;
- Barometric pressure during the monitoring event; and
- Ambient temperature during the monitoring event.

Monitoring for gas composition, pressure, and temperature will be performed using a portable combustible gas indicator capable of measuring the above parameters. Prior to the start of monitoring, the tester shall calibrate monitoring instruments in accordance with the manufacturer's specifications. The GMCS/GCCS will likely be sampled using the following sampling procedure:

- Record date, time and current weather conditions;
- Record initial data from Flare skid;
- Perform GW maintenance check at each GW;
- Record above parameters at each GW;
- Adjust flow through the wellhead at each GW based on the methane and oxygen measurements (if necessary); and
- Record end data from Flare skid.

### Maintenance Procedures

When the GCMS/GCCS monitoring includes the monitoring of the GWs, the sampler will inspect the integrity of the GWs. The sampler will record pertinent information on the LFG Monitoring Report Form which will be placed in the Site Operating Record. The sampler will also observe the wellhead during the monitoring event to

ensure no damage has occurred to the wellhead. If damage or excessive wear to the GW or wellhead is observed, it will be reported to the landfill manager and repaired within 30 days of the date damage is observed. If it is not possible to repair the GW, the Landfill will evaluate the effectiveness of replacing the GW within the gas collection system. If the GW is replaced, an as-built documentation report will be submitted to the TCEQ including boring and well installation logs.

The combustible gas monitoring instrument will be calibrated and maintained in accordance with the manufacturer's instructions.

## 3.7.5.3 Facility Structures Monitoring

### Monitoring Procedures

On-site buildings and structures designed for human occupation will be monitored, at a minimum, quarterly with a portable combustible gas indicator. The buildings shall be monitored quarterly with a hand held gas meter at the base of each exterior wall and also the ambient air.

If methane concentration exceeded allowable limits within structures, the building will be immediate evacuated and ventilated by opening doors and windows and placing a portable blower to blow clean air into the building. Notification consistent with the procedures outlined in Section 3.7.6.2 will be implemented immediately.

### Maintenance Procedures

The combustible gas monitoring instrument will be calibrated and maintained in accordance with the manufacturer's instructions.

## 3.7.5.4 Recordkeeping/Reporting

Field monitoring data records will be placed in the Site Operating Record and maintained onsite for inspection. Field data will be recorded on the LFG Monitoring Report Form provided in Appendix 3M.

## 3.7.5.5 Monitoring Frequency

LFG monitoring probes and facility structures will be monitored quarterly at a minimum. The facility will monitor the locations more frequently if monitoring results indicate that LFG migration is occurring or is accumulating in the structures.

GMCS monitoring is required on a monthly basis; however, Landfill personnel typically monitor on a weekly basis. GCCS monitoring will occur similarly to the GMCS monitoring and shall comply with 40 CFR Part 60, Subpart WWW §60.756.

# 3.7.6 Action Plan

## 3.7.6.1 Initial Response Measures

This action plan has been prepared for the protection of human health in the event concentrations of methane exceed allowable limits as required under 30 TAC §330.371. The action plan will address methane level exceedance measurements for both buildings and perimeter monitoring probes.

### Emergency Action

As defined in Section 3.7.1.1, the first action in the event that methane is detected at levels above regulatory limits is to protect human health. The following actions will be taken to protect human health dependent on the exceedance location.

#### *Permit Boundary*

If methane levels are detected above the regulatory limit in one of the GMPs, the landfill manager will be notified. The immediate emergency response measure will be for the landfill manager to determine if any nearby buildings or structures (including offsite) are at risk and if evacuation of the buildings or structures should be requested.

#### *Structures*

If methane concentration exceeded allowable limits within structures, the building will be immediate evacuated and ventilated by opening doors and windows and placing a portable blower to blow clean air into the building. The landfill manager will be notified of the exceedance, and personnel will not be allowed to reenter the building until additional measurements are taken.

### Verification Procedures

Once emergency action measures have been taken to protect human health, the landfill manager will require monitoring personnel to begin verification procedures. Verification procedures are intended to determine if the methane levels detected are accurate, or if erroneous levels have been detected.

#### *Permit Boundary*

Verification of the detected methane levels above regulatory limits in the GMPs will be conducted within 24 hours using the following procedures:

- Recalibrate gas detection equipment according to manufacturer's recommendations;
- After recalibration of the gas detection equipment, recheck the methane concentration in the GMP; and
- Recheck the methane concentration again within 7 days of the initial reading.

If the measured concentrations of methane are not above regulatory limits in the verification procedure, routine monitoring procedures will resume.

If the follow-up readings suggest that there are methane gas levels exceeding the regulatory limits, notification and remediate procedures must be implemented as described in Section 3.7.6.2 and Section 3.7.7.

*Structures*

Verification of detected methane levels in the facility structures shall be conducted within 24 hours of the exceedance by monitoring methane levels throughout the structure using a portable gas meter. Readings will be taken in each room and in any confined spaces. If any natural gas appliances exist in the structure, they should be checked for leaks.

If concentrations of methane above the regulatory limit are not detected, personnel may return to the structure. Daily follow-up verification readings must be made for a period of one week after the exceedance measurement. If the follow-up readings suggest that there are methane gas levels exceeding the regulatory limits, notification and remediate procedures must be implemented as described in Section 3.7.6.2 and Section 3.7.7.

### 3.7.6.2 Notification Procedures

When methane concentrations are detected above the regulatory limit, notification will be made immediately in accordance with §330.371. Within seven days from the date of an initial reading above allowable limits, the owner shall place in the Site Operating Record:

- Concentration of methane gas levels detected as well as time, date, and location;
- Description of steps taken to protect human health; and
- Information regarding the notifications to the Executive Director, local and county officials, emergency officials, and the public of the exceedance;

Within 60 days, the City shall take the following actions:

- Submit and implement a remediation plan for the methane gas releases that describes the nature and extent of gas migration and proposed remedy to the Executive Director; and
- Provide notification to the Executive Director that the remediation plan has been implemented.
- Place a copy of the remediation plan in the Site Operating Record.

## 3.7.7 Remediation Plan

If verification procedures confirm that the methane levels detected are above the regulatory limits in either an onsite structure or GMP, remediation actions shall be implemented within 60 days of detection. The initial remediation action will be an investigation of the cause of the exceeding methane levels. The investigation will be completed using all or part of the following items:

- Additional gas sampling at the landfill to determine concentrations of methane;

- Soil gas sampling to determine the extent of gas migration beyond the permitted landfill facility;
- Additional or increased GMP monitoring in the area of exceedance;
- Installation of additional GMPs or PVs in the area of exceedance; and
- Installation/expansion of an active LFG collection and control system.

Based on the results of the investigation, the Landfill will determine the appropriate course of action to ensure future methane concentration levels are below regulatory standards. In accordance with 30 TAC §330.371, a remediation plan describing the nature and extent of the problem and the proposed remedy will be submitted to the Executive Director within 60 days of detection that notifies the Executive Director of the plan and that the plan has been implemented. Copies of the remediation plan will be kept in the Site Operation Record. If the remediation plan includes any changes to the LFG Management Plan, approval will be received from the TCEQ prior to implementation.

## 3.7.8 Backup Plan

This backup plan will be applicable under the assumption that the active GCCS is required to be installed under NSPS and has been developed in accordance with 30 TAC §330.371(g)(3). In the event that the GMCS/GCCS breaks down, the backup plan will be to repair the GMCS/GCCS as soon as possible, dependent on weather, contractor, material, and equipment availability. During the repair period, monitoring frequency on the site GMPs will increase to monitoring levels determined at the time of repair.

The Final Closure Plan has been prepared in compliance with applicable regulations (30 TAC §330.63(h), 330.457, and 330.459) for the McCombs Landfill. Within 180 days of the last receipt of wastes for any MSWLF unit, the owner or operator will complete the installation of a final cover system as permitted, designed and constructed to minimize infiltration and erosion. This final closure plan includes the following:

- A description of the prescriptive final cover design, including methods for installation;
- A description of the alternative final cover design, including justification in accordance with the *Guidance for Authorizing a Water Balance Alternative Final Cover for a Municipal Solid Waste Landfill,* and methods for installation;
- An estimate of the largest area requiring final cover at any time during the active life of the landfill;
- An estimate of the maximum inventory of wastes on-site over the active life of the landfill; and
- A schedule for completing all final cover activities.

A copy of this closure plan will be included in the site operating record.

The Final Contour Map for the Landfill depicting the final contours, site access roads, top and side slopes, and surface drainage features is located in Appendix 3E - Site Layout Plans.

The estimated cost to hire a third party to perform the closure project can be found in Appendix 3N, Attachment 2 - Closure Cost Estimates.

## 3.8.1 Description of Final Cover Design

30 TAC §330.457(e)(1)

The final cover will be applied to areas of the Landfill as they reach final contour elevations shown on the Final Cover Plan in Appendix 3G - Construction Design Details, Drawing P3-33. The prescriptive final cover for areas of the Landfill with a synthetic bottom liner consists of a minimum of an eighteen inch infiltration layer over the intermediate and daily cover layers having a coefficient of permeability less than or equal to $1x10^{-5}$ cm/sec. The infiltration layer is then overlain with a synthetic flexible membrane with permeability less than that of the bottom liner system. Twelve inches of earthen material are then placed, providing the erosion layer. On top of the erosion layer, six inches of vegetative layer (or 4 inches of rock layer) is placed that can support and sustain native plan growth. The rock layer, if used instead of the

vegetative layer, would consist of rounded to sub-rounded river rock, crushed angular to sub-angular rock, or a combination of the two.

The synthetic membrane shall be a minimum of 40 mils (LLDPE) to ensure proper seaming. Drawing P3-34 in Appendix 3G - Construction Design Details, shows details for the prescriptive final cover system design for areas of the landfill that have a synthetic bottom liner. Drawing P3-29 in Appendix 3G details the Typical Landfill Perimeter Section, which shows how the liner is anchored to the existing grades.

An alternative final cover system has been designed for the McCombs Landfill. The alternative cover system includes only soil cover as opposed to a synthetic liner. The system will include the 12 inches of preliminary cover (6 inches of daily cover and 6 inches of intermediate cover) as is in the prescriptive cover, a 6-inch support layer, an 18 inch erosion layer, and a 4-inch top layer consisting of rock armor. The alternative final cover is in lieu of the low permeability soil, synthetic membrane liner and topsoil (or rock) described in the prescriptive cover above. Drawing P3-35 in Appendix 3G provides detail on the alternative final cover profile.

Appendix 3N - Closure Details presents a demonstration of the infiltration equivalency of the two final cover system options and justification for the alternative earth cover in accordance with the "*Guidance for Authorizing a Water Balance Alternative Final Cover for a Municipal Solid Waste Landfill"*.

Appendix 3B, Attachment 5 presents the calculated soil loss for the two final cover system options.

The prescriptive cover sequencing will be different for areas with bottom liner than for those without and both are described below.

### 3.8.1.1 Sequence of the Final Cover Installation

The following provides a general sequencing plan for the prescriptive final cover system installation for the Landfill areas that include a synthetic bottom liner:

- Apply the final six inches of daily cover, and if not closed within 180 days apply six inches of intermediate cover;
- Place 18 inches of earthen material (with a coefficient of permeability less than or equal to 1 X $10^{-5}$ cm/sec) that will serve as the infiltration layer;
- Place 40 mil LLDPE geomembrane;
- Place 12 inches of earthen material that will serve as the erosion layer;
- Place the 6 inch minimum earthen vegetative layer that is capable of supporting and sustaining native plant growth (or place 4 inches of crushed rock or river rock armoring in lieu of 6 inch earthen vegetative layer); and
- Refer to Drawing P3-34 - Final Cover Details, in Appendix 3G for details of this final cover system design.

The following provides a general sequencing plan for the prescriptive final cover system installation for the McCombs Landfill areas that do not include a synthetic bottom liner:

- Apply the final six inches of daily cover, and if not closed within 180 days apply six inches of intermediate cover;
- Place 18 inches of earthen material (with a coefficient of permeability less than or equal to 1 X $10^{-5}$ cm/sec) that will serve as the infiltration layer;
- Place the 6 inch minimum earthen vegetative layer that is capable of supporting and sustaining native plant growth (or place 4 inches of crushed rock or river rock armoring in lieu of 6 inch earthen vegetative layer);
- Refer to Drawing P3-34 in Appendix 3G for details of this final cover system design.

It should be noted that the only area that may receive the prescriptive final cover for areas that do not include a synthetic bottom liner include areas of existing unlined Landfill that will not receive any further waste, the western outside slope of Sector I and the southern outside slope of Sector J. The areas of the slopes for Sectors I and Sectors J are identified on Drawing P3-33B in Appendix 3G, Attachment 4. All other areas will either receive the prescriptive final cover system (with bottom liner) or the alternative final cover system described below.

The following provides a general sequencing plan for the alternative final cover system installation for the McCombs Landfill areas (both with and without a synthetic bottom liner:

- Apply the final six inches of daily cover and 6 inches of intermediate cover;
- Apply 6 inches of support soil compacted to 80%;
- Apply 18 inches of erosion soil compacted to 90%;
- Apply 4 inches of top layer consisting of rock armor;
- Refer to Drawing P3-35 - Alternative Cover Details, in Appendix 3G for details of this final cover system design.

### 3.8.1.2 Site Preparation

Site preparation includes clearing and grubbing vegetation in areas to receive intermediate cover. The intermediate cover will be prepared and graded to meet the criteria set forth in the Final Cover Quality Control Plan. Additional clean fill material from on-site native soil can be used to meet the required contour elevations.

### 3.8.1.3 Prescriptive Final Cover Construction

Testing and Evaluation of the prescriptive final cover system will be completed in accordance with 30 TAC §330.457(c). For the prescriptive cover, the infiltration material will be placed in accordance with the Final Cover Quality Control Plan (located in Appendix 3P) and will be tested at least once per surface acre for coefficient of permeability. Permeability data will be submitted to the TCEQ executive director. A liquid limit (LL) of not less than 30 and a plasticity index (PI) of not less than 15 are required, but lower values of Atterburg limits may be acceptable.

The remaining layers (membrane, erosion and vegetative or rock layers) will be installed in accordance with the Final Cover Quality Control Plan. If rock is chosen as the final layer, it will be graded to provide an interlocking framework for slope stability and to minimize erosion for surface water.

### 3.8.1.4 Alternative Final Cover Construction

Testing and Evaluation of the alternative final cover system will be completed in accordance with the TCEQ Guidance for Authorizing a Water Balance Alternative Final Cover for a Municipal Solid Waste Landfill and findings of the Unsat-H model and report found in Appendix 3N - Closure Details. For the alternative cover, the support layer will be much less dense than the infiltration material utilized in the prescriptive cover. The Interstate Technology and Regulatory Council (ITRC) Alternative Landfill Technologies Team states that a range of 75-85% compaction is best for evapotranspiration monolithic soil final cover systems. This layer will be placed at 80% compaction.

The erosion layer will be installed in accordance to the TCEQ Guidance for Authorizing a Water Balance Alternative Final Cover for a Municipal Solid Waste Landfill and finding of the Unsat-H model and report found in Appendix 3N. This layer will be placed at 90% compaction.

### 3.8.1.5 Final Cover Construction Activities for both Prescriptive and Alternative Systems

A gas venting system will be implemented to dissipate the gas produced by anaerobic degradation of the waste at the site. Drawings P3-41 and P3-42, in Appendix 3M - Landfill Gas Management Details, provide landfill gas venting system details. Any gas collection system used at the site will be designed and installed with approval of the TCEQ.

Erosion and soil loss preventative measures and maintenance will be required for the final cover. Calculations using the Revised Universal Soil Loss Equation (RUSLE) for estimating soil loss on the final cover of the landfill can be seen in Appendix 3B, Attachment 5 – Closure Soil Loss Calculations. Refer to Appendix 3G for slope stability analysis.

## 3.8.2 Largest Area Requiring Final Cover

30 TAC §330.457(e)(2)

The largest open area at the McCombs Landfill at any given time is not expected to exceed approximately 222.8 acres for areas that will ever require final cover. The landfill development plan has been broken into different sections to be constructed over time and therefore smaller sections of the total may be closed individually or collectively as they reach permitted maximum elevations. The largest area of closure is during Sector G development, prior to the closure of Sector F, for which the total open area is 113.2 acres and the incremental closure area is 18.3 acres. Also included

at that time will be 70.8 acres in the existing unlined landfill area and 20.5 acres lined landfill area in the existing Phase I and II areas. The filling sequence is provided in the Appendix 3E - Site Layout Plans.

P3-45 provides the largest open area at any time during site development that will require final cover (222.8-acres). The final cover portrayed is for both the existing and future sector boundary extensions. P3-45 is only applicable at the time of Sector G development (i.e., prior to the development of the piggyback area). It should be noted final cover will not be placed on the existing unlined (70.8 acres) and lined (20.5 acres) areas prior to the piggyback liner unless the Landfill is closed prior to development of the piggyback area (Sectors H-J) and the vertical expansion of Sector K.

## 3.8.3 Maximum Waste Inventory

30 TAC §330.457(e)(3)

Approximately 5,964,060 cubic yards (cy) of waste (and intermediate cover) have been landfilled in the existing completed phases of the Landfill, as of December 31, 2010.

The total Landfill volume was estimated using AutoCAD by comparing the top of geomembrane to the top of final cover. The total remaining Landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including waste and daily**,** intermediate, and final cover), which provides capacity through 2014 based on table 3H-1 in Appendix 3H-Site Life Projections. The total remaining Landfill volume available for waste disposal including the remainder of Sector A and all subsequent planned sectors (B through K) is 63,469,470 CY. Given the remaining capacity above, the remaining estimated life of the Landfill is until 2059. The total volume in place at that time will be 69,433,530 CY.

## 3.8.4 Closure Schedule

30 TAC §330.457(e)(4), 330.457(f), and 330.457(g)

The McCombs Landfill will be efficiently closed by the following procedure:

- The Owner/Operator will provide written notification to the TCEQ within 45 days prior to beginning final closure activities stating their intent to close a section of the facility or the entire facility site. This notice will also be placed in the operating record.
- The Owner/Operator will publish a public notice of final closure in the largest circulating newspaper in the facility area within 90 days prior to beginning final closure activities of the entire facility site. This notice will include name, address, location of the facility, permit number, and date of final receipt of waste. Copies of the final closure plan will be made available for the public to review.

- At least one sign will be posted at the main entrance (and others where appropriate around the site perimeter) following the closure date notifying readers of the final date of closure.
- Barriers shall be installed at all entrances, gates, or access points to the Landfill following closure in order to prevent unauthorized dumping of solid waste.
- Final closure for the entire facility site shall begin no later than 30 days after the date on which the Landfill receives final waste. If the Landfill has remaining capacity and will likely continue to receive additional waste then final closure will continue no later than one year after receipt of final waste. If time beyond the one year is necessary, a request for extension may be submitted to the executive director for review and approval. The request must include documentation demonstrating the site had capacity to receive additional waste and that the owner/operator has taken steps and will continue to take steps to prevent threats to human health and environment from the unclosed portions of the site.
- The Final closure in accordance with this plan shall be completed within 180 of initiation of final closure activities. If it is likely to take beyond 180 days, an extension can be requested in writing to the executive director. The request must include all documentation demonstrating that closure will take longer than 180 days and that the owner/operator has taken steps and will continue to take steps to prevent threats to human health and environment from the unclosed portions of the site.
- Documented certification by an independent licensed Professional Engineer will be submitted to the TCEQ following completion of final closure certifying completion in accordance with the final closure plan and including all documentation necessary for certification of final closure. A copy of the approved certification from the TCEQ will be placed in the operating record.
- Within 10 days of final completion of closure activities for the Landfill, the owner/operator will submit a certified copy of an Affidavit to the Public to the Executive Director. A copy will also be placed in the operating record. The affidavit will include an updated metes and bounds description of the extent of the disposal areas.
- A certified notation will be recorded on the deed to the property the facility is on that will in perpetuity notify a potential purchaser that the land has previously been used as a landfill. The use of this land will be restricted to the provisions specified in Section 3.9 - Post-Closure Plan. The owner/operator will submit a certified copy of the modified deed to the Executive Director and place a copy in the site operating record within 10 days of final completion of closure activities for the Landfill.

## 3.8.5 Final Contour Map

30 TAC §330.457(e)(5)

A final contour map depicting the final contours, 100-year floodplain, and establishing top slopes and sideslopes for the McCombs Landfill is provided in Appendix 3E - Site

Layout Plan, Drawing P3-16. No structural designs for collection and conveyance along the top and side slopes (i.e., berms, dikes, chutes) are recommended as the final cover design meets the requirements for soil loss and non-erodible velocities.

## 3.8.6 Final Closure Costs

30 TAC §330.503

The estimated cost to hire a third party to perform the closure project (for the largest area to ever require final cover, identified in section 3.3.2) can be found in Appendix 3N, Attachment 3 - Closure Cost Estimates.

Additionally, in order to comply with 30 TAC §330.503(b), a copy of the City's current financial assurance cost estimates for the facility are provided in Appendix 3N, Attachment 3.

The Post-Closure Plan has been prepared in compliance with applicable regulations (30 TAC §330.463(b) and 330.465) for the McCombs Landfill. Post-closure care maintenance will begin upon completion of final-closure activities and approval by the TCEQ. This post closure plan includes the following:

- Provisions for groundwater and landfill gas monitoring, leachate collection, and maintenance activities for the final cover system and drainage facilities to be conducted during post-closure care period, and the frequency at which these activities will be performed;
- Provisions for reducing the post-closure care period;
- The name, address, and phone number for the responsible party in charge of the post-closure care activities during the duration of the 30-year post-closure period; and
- Provisions for certification at the completion of the post-closure care period.

## 3.9.1 Post-Closure Monitoring and Maintenance Activities

The period of post-closure will be 30 years unless approval from TCEQ allows a change in duration. The City of El Paso will maintain the right of entry and all right-of-ways to the facility throughout this period. Maintenance activities include annual site inspections (unless otherwise stated below) with a written summary and will consist of, but are not limited to the following:

- Maintenance and/or remediation activities, as needed, to maintain the integrity and effectiveness of the final cover system, site vegetation, and storm water drainage control systems. Activities may include regrading, addition of soil, seeding, and erosion and sedimentation control structure repairs;
- Control surface run-on and run-off in order to minimize erosion of the final cover system. Activities may include regarding, addition of soil, seeding, and erosion and sedimentation control structure repairs or cleaning;
- Control of undesirable vegetation growth on the final cover system;
- Correct the effects of settlement, subsidence, ponded water, erosion, or other events or failures in as much as these situations are detrimental to the integrity of the closed landfill. Activities may include regarding, addition of soil, seeding, or removal of water or sediment;
- Maintain the integrity of on-site structures, roads, gates and fences;
- Maintain groundwater monitoring in accordance with Section 3.6, Groundwater Sampling and Analysis Plan and 30 TAC §330.401–330.421. The monitoring

frequency shall be semi-annual. Parameters to be monitored will be in accordance with 30 TAC §330.419 unless otherwise approved by the TCEQ;

- Maintain and operate the leachate control system in accordance with Section 3.5, Waste Management Unit Design Plan, Appendix 3I, Leachate and Contaminated Water Plan, and 30 TAC §330.331 and 330.333 unless otherwise approved by the TCEQ and leachate no longer poses a threat to human health and the environment;
- Maintain and operate the landfill gas monitoring system in accordance with Section 3.7, Landfill Gas Management Plan and 30 TAC §330.371. Monitoring frequency shall be quarterly unless otherwise approved by the TCEQ;
- Retain the Site Operating Record and documentation of post-closure care activities, including monitoring results and records of inspections and maintenance performed;
- Maintain the required benchmark and landfill markers; and
- Repair/Replace gas probes, gas extraction wells, leachate collection and removal system components, groundwater monitoring system components as necessary.

## 3.9.2 Post-Closure Care Period

The length of the post-closure maintenance period may be decreased or increased by the TCEQ. If the Landfill submits documentation, signed by an independent registered professional engineer, that demonstrates that a reduced period will sufficiently protect human health and the environment, the TCEQ may review and approve a decrease in the post-closure care period. If it is determined that an increased duration is necessary to protect human health and the environment, notification will be given to the Landfill prior to any such change by the TCEQ.

Certification of completion of the post-closure care period and voluntary permit revocation will be in accordance with 30 TAC §330.465 upon completion of the post-closure care maintenance period. The Landfill must submit a documented certification, signed by an independent registered professional engineer, verifying the post-closure care has been in accordance with the approved plan. The submittal shall also include all necessary documentation for certification of completion of post-closure care.

## 3.9.3 Contact for Post-Closure Activities

The following is the current responsible party overseeing the post-closure care maintenance activities for the facility:

The City of El Paso
Environmental Services
7968 San Paulo Drive
El Paso, Texas 79907
Phone: (915) 621-6700
Fax: (915) 621-6711

The person responsible for post-closure care activities is subject to change. In the event there is a change, the TCEQ will be notified.

## 3.9.4 Post-Closure Land Use

Other than open space, there are no proposed uses or plans at this time for the McCombs Landfill following closure. Any proposed uses will be submitted to the TCEQ for review and approval.

## 3.9.5 Post-Closure Costs

30 TAC §330.507

The estimated costs associated with post-closure care maintenance of the McCombs Landfill can be found in Appendix 3O - Post-Closure Details.

Additionally, in order to comply with 30 TAC §330.503(b), a copy of the City's current financial assurance cost estimates for the facility are provided in Appendix 3N, Attachment 3.

The Erosion and Sedimentation Control Plan has been developed to provide proper management and control measures for existing and developed conditions. These measures will provide management of soil erosion and control of sedimentation due to stormwater runoff.

## 3B.1 Drainage Conditions

The McCombs Landfill is an existing municipal solid waste disposal facility located in Section 6, Block 80, Township 1, within the city limits of El Paso, at the intersection of McCombs Road and FM 2529 (Stan Roberts Sr. Road). The site covers 347 acres and the surrounding areas are largely undeveloped. To the west of McCombs Road is the Public Service Board - El Paso Water Utilities' Sludge Monofill.

The soils in the Landfill area are predominantly Turney-Berino Association, moderately deep over soft caliche, in the Hueco Bolson. The soils are characterized as moderately permeable, having high water-holding capacity, and having a slow runoff rate. Caliche covers the entire Bolson surface and ranges in thicknesses of immeasurable to 8 feet thick.

### 3B.1.1 Existing Conditions

The existing drainage patterns and flow rates are shown on Drawing P3-4 - Existing Drainage Conditions in Appendix 3C.

Stormwater runoff is collected in a v-ditch around the perimeter of the Landfill units and is directed into an existing stormwater pond. Runoff from north of the existing Landfill is currently captured within the mined pit area. Some of the runoff in the northwest corner continues to the site of existing Retention Pond A. Runoff generated to the east is captured in the mined pit area. Runoff generated in the existing landfill areas is conveyed into existing Retention Pond D, west of the existing fee house, and existing Retention Pond E, in the southeastern corner of the developed Landfill area. These exiting stormwater patterns are shown on Drawing P3-4 - Existing Drainage Conditions, in Appendix 3C. Stormwater from the 19.4 acre site entrance facilities area (existing conditions) generally flows to natural low lying areas and infiltrates.

There is an area of the Landfill, including Pond A, to the northwest corner that lies within the 100-year floodplain as shown on the Flood Insurance Rate Map (FIRM) Panel No. 480214 0004 C and Appendix 3D, Drawing P3-14 – 100-Year Floodplain Map. The base flood elevations (BFE's) were converted from NGVD 29 Datum to the City of El Paso Vertical Datum with a factor provided by Land-Mark Professional Surveying Incorporated. As shown on Drawing P3-8, the BFE's are below the site berms located around the site, and therefore the 100-year flood will be diverted around the Landfill site to the north and will not affect stormwater elevations within Pond A

nor will the BFE's affect Landfill operations. The FIRM map is provided in Appendix 3D, Drawing P3-13.

### 3B.1.2 Developed Conditions

The Landfill Completion Plan is provided as Drawing P3-16 in Appendix 3E–and shows all final developed conditions. The final contours include four ponds to break up drainage areas (the existing Retention Ponds A and E, and Ponds B and C), and in effect reduce sheet flow and minimize erosion. Existing Pond D is no longer needed as that area is filled to grade and flow is conveyed in a v-ditch to Pond E.

During construction, temporary diversions and drainage swales will be constructed to prevent unauthorized discharge of surface water and sediment. The final developed conditions will include perimeter v-ditches and ponding areas to control all site stormwater runoff. The retention ponds on site do not have an outlet structure and water will drain down via infiltration or evaporate. Drawing P3-6 in Appendix 3C shows final drainage conditions and controls.

The final drainage conditions plan for the site entrance facilities area is provided as Drawing C-13 in Appendix 3E. Stormwater from the site entrance facilities area will be contained in one of six onsite detention areas (labeled as DA-1 through DA-6). All runoff from the site will be contained in onsite retention basins.

## 3B.2 Erosion and Sedimentation Controls

### 3B.2.1 TPDES Multi-Sector General Permit

The facility has been designed to prevent discharge of pollutants into waters of the State or waters of the United States, as defined by the Texas Water Code and the Federal Clean Water Act. An erosion and sedimentation control plan is provided in Appendix 3C, Drawing P3-11. The McCombs Landfill submitted a notice of intent (NOI) to comply with the TPDES Multi-Sector General Permit relating to stormwater discharge and received Permit No. TXR05L795 from the TCEQ on October 28, 2011. A copy of this permit is included in Appendix 2D – TPDES Multi-Sector General Permit.

### 3B.2.2 Best Management Practices (BMP's) Structural Controls

During construction phases, temporary controls will be implemented for erosion and sedimentation management. Throughout the entire phasing of construction intermediate controls will be implemented and upon final closure permanent erosion control practices will be implemented.

Structural controls may include, but are not limited to, silt fence, earthen diversion berms and dikes, drainage swales, and rip-rap. These structural controls will be implemented as follows:

- Upon final completion of Landfill development and closure, perimeter v-ditches will be constructed to divert stormwater runoff to the ponding areas shown on Drawing P3-11 - Erosion Control Plan. Ditches having velocities that exceed 4 feet per second (fps) will be protected against erosion as required by the maximum

non-erodible velocities as published in the USDA-SCS Engineering Field Manual. The default lining condition for all channels with peak velocity below 4 fps is vegetative lining. For all channels with maximum velocities below 4 fps another structural control option is velocity control. These controls include either ditch checks or sediment logs, and will be placed with appropriate size and spacing to keep the velocity in the channel lower than the maximum non-erodible velocity for the selected cover conditions (1.5 fps for bare soil and 4 fps for vegetation).

- For channels where neither an appropriate lining system or velocity control system, a sediment capture and replenishment system may be used instead. Because each retention pond on the site has been designed to hold a 100-year storm plus a sediment load, these ponds will be used as temporary sediment capture facilities. After each storm event each pond which has an upstream channel which lacks appropriate lining or velocity control shall have captured sediment removed such that the pond remains at the permitted capacity. The removed sediment will be placed in the upstream channels such that they maintain their permitted shape and slope. Suggested capture structures include silt fences, and sediment traps.
- When areas of the Landfill reach final design elevations, proper care will be taken to ensure that the vegetative layer is maintained to support native plant growth or that the rock cover is properly maintained. Intermediate slopes may also be vegetated depending on the length of time the area is exposed prior to commencing final grade preparations. The site will stockpile excess soil that will be used for operations at the Landfill, and thus will vegetate a portion of the stockpile material to prevent soil erosion due to wind and water along with silt fencing measures.
- In accordance with the Final Closure Plan, Section 3.8, a vegetative layer will be established upon final closure to prevent erosion. The soils used for the vegetative layer shall be evaluated for proper nutrient contact for supporting native plant life. Areas requiring intermediate vegetative cover for erosion protection during cool seasons will be mulched and seeded with a fast germination species such as red and/or winter wheat, western wheatgrass, and tall fescue or other species as recommended by local NRCS Texas Agricultural Extension Service Officials.
- Silt fence or earthen berms will be installed around stockpile areas, construction areas, or other areas of open soil to prevent sedimentation to stormwater runoff. Other BMP's as stated above may be utilized during different phases of Landfill development.
- Silt fence, sediment traps, sediment logs, and any other sediment capture devices will be placed at the toe of slope for intermediate cover side slopes which do not receive vegetative cover as a part of a sediment capture and slope replenishment program. For this program all sediment captured by the installed structural controls will be removed from the control and replaced on the slope upstream of the control. Controls will also be placed on the side slopes which will be placed such to keep the flow velocity below 1 fps. The structural controls will be checked for sediment build-up as specified in Table 3B-2.

Parameters for the installation of the structural controls can be found in Table 3B-1.

Table 3B-1
Structural Control Parameters[A]

| Control | Typical Placement | Max Spacing/ Max Drainage Area | Slope Restrictions |
|---|---|---|---|
| Silt Fence | Downstream of disturbed area which has not received permanent erosion controls | 100 ft<br>75 ft<br>50 ft<br>25 ft | 3%-5%<br>5%-10%<br>10%-20%<br>20%-50% |
| Hay Bales | Downstream of disturbed area which has not received permanent erosional controls | 100 ft max spacing | 3:1 max |
| Rock Filter Dam (Type 1) | Toe of slope, around inlets, in small ditches, and swale outlets | 5 acres max | 2:1 max |
| Rock Filter Dam (Type 2) | In larger ditches and at swale outlets | 5 acres max | 2:1 max |
| Rock Filter Dam (Type 3) | In stream flow, attached to the stream bed | 5 acres max | 2:1 max |
| Rock Filter Dam (Type 4) | In ditches and smaller channels | 5 acres max | 2:1 max |
| Ditch Checks | In swales or channels | 5 acre max, spaced for desired velocity | 3:1 max |
| Sediment Logs | In swales, channels, or on slopes | 25 to 50 ft. while slowing flow, 100 ft. once at desired velocity | 2:1 max |

[A] – Table obtained from the Erosion and Sedimentation Control Plan by Parkhill, Smith & Cooper dated July 2009.

### 3B.2.3 Best Management Practices (BMP's) Non-Structural Controls

Non-structural controls include maintenance during daily operations at the Landfill. Any visual evidence of soil erosion shall be addressed by placing addition soil or adding/relocating structural controls. All drainage ways will be inspected for accumulation of sediment and maintained as necessary to ensure proper capacity for stormwater conveyance. The suggested inspection and maintenance schedule and the Controls Installation Schedule are provided in Tables 3B-2 and 3B-3, respectively. It is the Site Supervisors responsibility to ensure that these maintenance activities are completed and controls are in place and operational.

Non-Structural controls include:

- Plans and designs to disturb only the smallest area necessary to perform current activities and to minimize disruption of the natural drainage, topography, and vegetative cover features.
- Phased development to minimize the area of bare soil exposed at any given time.
- Specific plans for the stabilization of exposed surfaces in a timely manner.
- Scheduling of construction activities during the time of year with the least erosion potential.

Table 3B-2 lists suggested maintenance and inspection schedule for the Landfill.

Operations Division
Regulatory Branch

Mr. Roberto Moreno, P.E.
Moreno Cardenas Inc.
2505 E. Missouri Ave.
El Paso, TX 79903

Dear Mr. Moreno:

This replies to your July 16, 2002, letter regarding the proposed expansion of McCombs Landfill in El Paso, El Paso County, Texas. We have assigned Action No. 2002 00462 to this activity.

We have evaluated the information you provided and studied the project description, other records, and documents available to us. We concur with your findings that no waters of the United States are located within the project site. There are no Corps of Engineers' jurisdictional waters on the site. Therefore, the project is not regulated under the provisions of Section 404 of the Clean Water Act and a Department of the Army permit will not be required.

Our disclaimer of jurisdiction is only for Section 404 of the Federal Clean Water Act. Other Federal, state and local laws may apply to the activities. Therefore, you should also contact other Federal, state and local regulatory authorities to determine whether the activities may require other authorizations or permits.

This jurisdictional determination will be valid for 5 years from the date of this letter unless new information warrants revision of the determination within that time.

If you have any questions, please feel free to contact me at (915) 568-1359 or e-mail me at daniel.malanchuk@usace.army.mil.

For more information about the regulatory program, please see our web site at www.spa.usace.army.mil/reg.

Sincerely,

Daniel Malanchuk
Chief, El Paso Regulatory Office

## NOTES

1. MAXIMUM LENGTHS FOR EACH DRAINAGE AREA (DEV) FOR BOTH THE TOP DOME AND SIDE SLOPE ARE INDICATED ON THE DRAWING. THE SELECTED MAXIMUM LENGTH UTILIZED IN THE SOIL LOSS CALCULATIONS IS INDICATED BY THE LEGEND BELOW. THE MAXIMUM DRAINAGE LENGTH IS SELECTED TO PORTRAY THE SOIL LOSS VALUES AS IT IS THE MOST CONSERVATIVE FOR ALL DRAINAGE AREAS.

## NOTES

1. THE MAXIMUM SIDE SLOPE LENGTH FOR THE INTERIM LANDFILL PHASES IS INDICATED ON THE DRAWING. THE MAXIMUM LENGTH IS UTILIZED IN THE SOIL LOSS CALCULATIONS. THE MAXIMUM INTERIM DRAINAGE LENGTH IS SELECTED TO PORTRAY THE INTERIM SOIL LOSS VALUE AS IT IS THE MOST CONSERVATIVE FOR ALL INTERIM DRAINAGE AREAS.

[1] Assumes a random distribution of cover types over the entire area of evaluation. Idle land refers to land with a soil profile that has not been disturbed for at least 3 consecutive years.

[2] Expresses the effectiveness of the vegetative canopy in reducing the energy of rainfall striking the soil surface.

[3] Average fall height of water droplets from the canopy to the soil surface or ground cover.

[4] Portion of total area of the surface that would be hidden from view by the canopy in an overhead projection.

[5] Portion of vegetation, mulch, cryptogams, rocks and other non-erodible material that is in direct contact with the soil surface. Affects erosion by reducing the transport capacity of runoff water by causing deposition.

# Appendix 3B – Attachment 6
# Drainage Calculations

SAIC®

McCombs Landfill
MSW Permit No. 729B Major Permit Amendment
Non-Erodible Velocities - Equations

$T_c$ = Time of Concentration (minutes)
Calculated using the Watershed Lag Method in the National Engineering Handbook §630.1502
$= (L / 0.6) \times 60$

L = Lag Time (hours)
$= /^{0.8} (S + 1)^{0.7} / 1900 \times Y^{0.5}$

S = Potential Maximum Retention (inches)
$= (1000 / CN) - 10$

Y = Average Land Slope (%)

/ = Hydraulic Length of Watershed (feet)

CN = Curve Number

$I_{25}$ = 25-year Intensity (in/hr)
$= b / (T_c + d)^e$

| | |
|---|---|
| $e_{25}$* | 0.843 |
| $b_{25}$* | 60 |
| $d_{25}$* | 12 |

*e, b, and d coeffients are provided in the Hydrology section of the Hydraulic Design Manual for Texas counties for various frequencies and are based on the rainfall-frequency-duration data contained in the National Weather Service Technical Paper 40 (TP 40)

$V_{25}$ = 25-year Volume (ac-ft)
$= C \times I_{25}$

| | | |
|---|---|---|
| Calculation by: | JSR | 11/02/12 |
| Checked by: | FJD | 11/02/12 |

## NOTES

1. DIGITIZED TOPOGRAPHY FROM AERIAL SURVEY COMPLETED IN FEBRUARY 2011 BY COOPER AERIAL SURVEYS COMPANY, TUCSON, AZ. TOPOGRAPHY PROVIDED BY FRANK X. SPENSER & ASSOCIATES, INC., EL PASO, TEXAS.
2. COORDINATES ARE BASED ON THE TEXAS STATE PLANE COORDINATE SYSTEM, CENTRAL ZONE, NAD 83. ELEVATIONS ARE CITY OF EL PASO VERTICAL DATUM. NAVD 88 DATUM TO NGVD 29 DATUM, SUBTRACT 1.99-FEET. NGVD 29 DATUM TO CITY OF EL PASO DATUM, ADD 27.65-FEET.
3. EXISTING CONTOUR INTERVAL IS TWO FEET.
4. SITE TOPOGRAPHY MAY VARY DUE TO OWNER'S OPERATIONS.
5. THE HATCHED AREAS DELINEATED ARE INDICATIVE OF OFF-SITE RUN-ON FROM ADJACENT PROPERTIES. THE QUANTITY OF RUN-ON IS ACCOUNTED FOR IN THE DRAINAGE CALCULATIONS.

## NOTES

1. POND DESIGN CAPACITIES PROVIDED BY PREVIOUS PERMIT, DATED APRIL 2002, BY MORENO CARDENAS; AND UPDATE TO GROUNDWATER/SURFACE WATER PROTECTION PLAN, DATED MARCH 2009, BY PARKHILL, SMITH & COOPER, INC.
2. POND HIGH WATER ELEVATIONS ARE 100 YEAR, 24 HOUR STORM EVENT VOLUMES FOR THE FINAL DRAINAGE CONDITIONS SHOWN ON P3–6.
3. ELEVATIONS ARE CITY OF EL PASO VERTICAL DATUM.

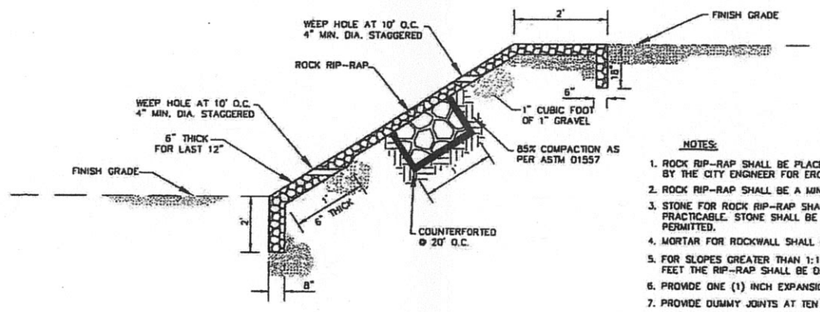
TYPICAL HEADWALL DETAIL
SCALE: N.T.S.
SEE NOTES 1 AND 2



NOTES:

1. ROCK RIP-RAP SHALL BE PLACED ON EMBANKMENTS OR SLOPES WHERE REQUIRED BY THE CITY ENGINEER FOR EROSION PROTECTION, EXCEPT FOR PONDING AREAS.
2. ROCK RIP-RAP SHALL BE A MINIMUM OF 8" MORTARED ROCK.
3. STONE FOR ROCK RIP-RAP SHALL BE AS NEARLY UNIFORM IN SECTION AS IN PRACTICABLE. STONE SHALL BE QUARRIED; FRACTURED RIVER ROCK SHALL NOT BE PERMITTED.
4. MORTAR FOR ROCKWALL SHALL BE TYPE S, 1800 P.S.I. AS PER ASTM C270.
5. FOR SLOPES GREATER THAN 1:1 OR VERTICAL HEIGHT OF MORE THAN SIX (6) FEET THE RIP-RAP SHALL BE DESIGNED BY A PROFESSIONAL ENGINEER.
6. PROVIDE ONE (1) INCH EXPANSION JOINT AT EVERY FIFTY (50) FEET.
7. PROVIDE DUMMY JOINTS AT TEN (10) FEET O.C.
8. NON-MORTARED ROCK RIP-RAP SHALL BE ALLOWED WHERE APPROVED BY DEPUTY DIRECTOR FOR ENGINEERING.

GENERAL NOTES:
DESIGNED ACCORDING TO CURRENT AASHTO STANDARD AND INTERIM SPECIFICATIONS.
REINFORCING STEEL SHALL BE PLACED WITH THE CENTER OF THE OUTSIDE LAYER OF BARS 2" FROM THE SURFACE OF THE CONCRETE.
ALL REINFORCING STEEL SHALL BE GRADE 60.
ALL CONCRETE SHALL BE CLASS "C" AND SHALL HAVE A MINIMUM 28 DAY COMPRESSIVE STRENGTH OF 3600 PSI.

## NOTES

1. DETAILS PROVIDED IN PREVIOUS PERMIT, DATED APRIL 2002, BY MORENO CARBENAS, INC. SIGNED BY ROBERTO MORENO, P.E.
2. THE LOCATION OF THIS HEADWALL IS SHOWN ON P3-6. THE CULVERTS WILL DISCHARGE WATER FROM THE EXISTING RETENTION POND TO STORMWATER RETENTION POND C.

## NOTES

1. A STORMWATER POLLUTION PREVENTION PLAN FOR CONSTRUCTION ACTIVITIES WILL BE PREPARED PRIOR TO INITIAL CONSTRUCTION.
2. A STORMWATER POLLUTION PREVENTION PLAN FOR INDUSTRIAL ACTIVITIES WILL BE PREPARED PRIOR TO LANDFILLING ACTIVITIES.
3. RIP-RAP OR OTHER EROSION PROTECTION SHALL BE USED WHERE VELOCITIES EXCEED 4.0 FPS.
4. A VEGETATIVE OR ROCK ANCHORING LAYER SHALL BE ESTABLISHED UPON FINAL CLOSURE TO PREVENT EROSION.
5. SILT FENCE OR EARTHEN BERMS SHALL BE USED AS NEEDED DURING CONSTRUCTION OF FINAL COVER.
6. DETAILS OF SOME EROSION CONTROL BMP'S CAN BE SEEN ON P3-12.
7. DRAINAGE DITCH ALONG ACCESS ROAD WILL HAVE CONVEYANCES AT THE TWO LOCATIONS SHOWN TO ENSURE DRAINAGE PATTERNS ON P3-6.
8. CONTOUR INTERVAL IS FIVE FEET. ELEVATIONS ARE CITY OF EL PASO VERTICAL DATUM.

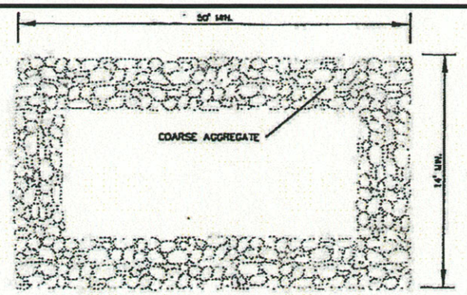
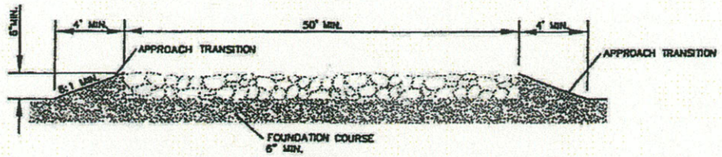
EROSION CONTROL PLAN

PROJECT NUMBER 9631500115
SHT. 44 OF: 78
DRAWING NUMBER: P3-11



PLAN

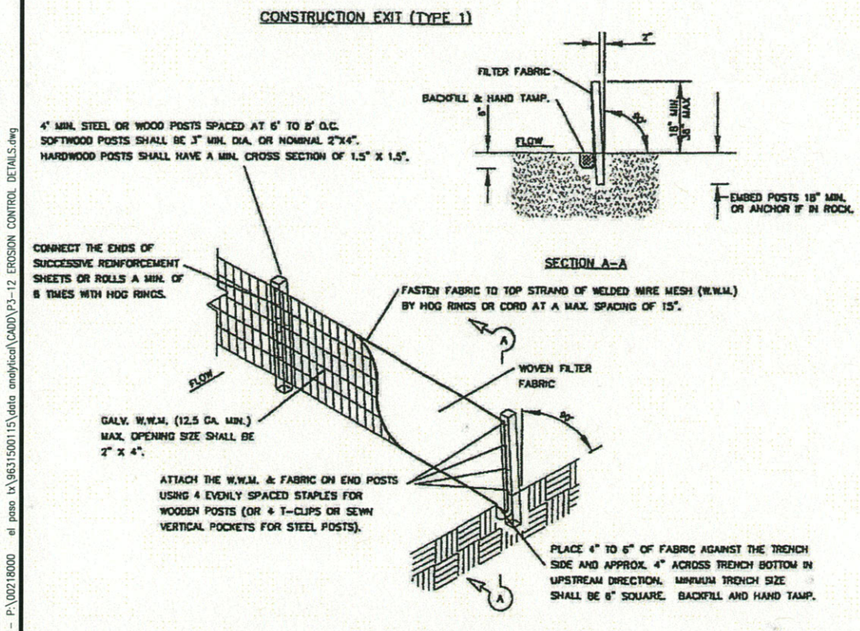


PROFILE

GENERAL NOTES

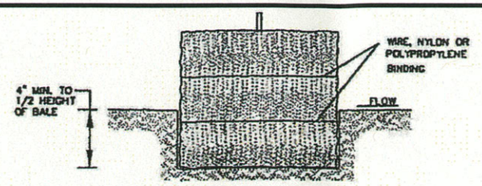
1. THE LENGTH OF THE TYPE 1 CONSTRUCTION EXIT SHALL BE AS INDICATED ON THE PLANS, BUT NOT LESS THAN 50'.
2. THE COARSE AGGREGATE SHOULD BE OPEN GRADED WITH A SIZE OF 4" TO 8".
3. THE APPROACH TRANSITIONS SHOULD BE NO STEEPER THAN 6:1 AND CONSTRUCTED AS DIRECTED BY THE ENGINEER.
4. THE CONSTRUCTION EXIT FOUNDATION COURSE SHALL BE FLEXIBLE BASE, BITUMINOUS CONCRETE, PORTLAND CEMENT CONCRETE OR OTHER MATERIAL AS APPROVED BY THE ENGINEER.
5. THE CONSTRUCTION EXIT SHALL BE GRADED TO ALLOW DRAINAGE TO A SEDIMENT TRAPPING DEVICE.
6. THE GUIDELINES SHOWN HEREON ARE SUGGESTIONS ONLY AND MAY BE MODIFIED BY THE ENGINEER.

CONSTRUCTION EXIT (TYPE 1)

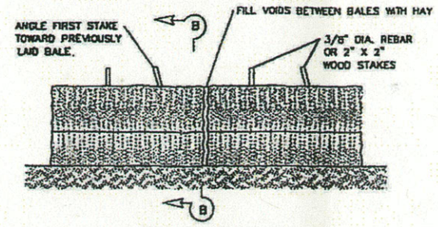


SECTION A-A

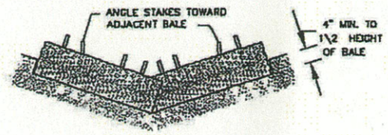
TEMPORARY SEDIMENT CONTROL FENCE



SECTION B-B



BALED HAY FOR EROSION CONTROL



PROFILE VIEW

BALED HAY USAGE GUIDELINES

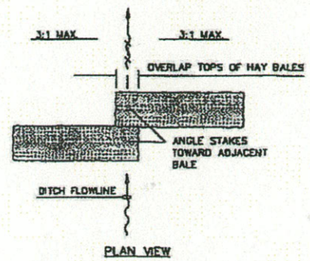
A BALED HAY INSTALLATION MAY BE CONSTRUCTED NEAR THE DOWNSTREAM PERIMETER OF A DISTURBED AREA ALONG A CONTOUR TO INTERCEPT SEDIMENT FROM OVERLAND RUNOFF. A TWO YEAR STORM FREQUENCY MAY BE USED TO CALCULATE THE FLOW RATE TO BE FILTERED. THE INSTALLATION SHOULD BE SIZED TO FILTER A MAXIMUM FLOW THRU RATE OF 5 GPM/FT$^2$ OF CROSS SECTIONAL AREA. BALED HAY MAY BE USED AT THE FOLLOWING LOCATIONS:

1. WHERE THE RUNOFF APPROACHING THE BALED HAY FLOWS OVER DISTURBED SOIL FOR LESS THAN 100'. IF THE SLOPE OF THE DISTURBED SOIL EXCEEDS 10%, THE LENGTH OF SLOPE UPSTREAM THE BALED HAY SHOULD BE LESS THAN 50'.
2. WHERE THE INSTALLATION WILL BE REQUIRED FOR LESS THAN 3 MONTHS.
3. WHERE THE CONTRIBUTING DRAINAGE AREA IS LESS THAN 1/2 ACRE.

FOR BALED HAY INSTALLATIONS IN SMALL DITCHES, THE ADDITIONAL FOLLOWING CONSIDERATIONS APPLY:

1. THE DITCH SIDESLOPES SHOULD BE GRADED AS FLAT AS POSSIBLE TO MAXIMIZE THE DRAINAGE FLOWRATE THRU THE HAY.
2. THE DITCH SHOULD BE GRADED LARGE ENOUGH TO CONTAIN THE OVERTOPPING DRAINAGE WHEN SEDIMENT HAS FILLED TO THE TOP OF THE BALED HAY.

BALES SHOULD BE REPLACED USUALLY EVERY 2 MONTHS OR MORE OFTEN DURING WET WEATHER WHEN LOSS OF STRUCTURAL INTEGRITY IS ACCELERATED.



PLAN VIEW

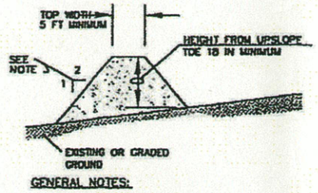
GENERAL NOTES

1. HAY BALES SHALL BE A MINIMUM OF 36" IN LENGTH AND WEIGH A MINIMUM OF 50 LBS.
2. HAY BALES SHALL BE BOUND BY EITHER WIRE OR NYLON OR POLYPROPYLENE STRING. THE BALES SHALL BE COMPOSED ENTIRELY OF VEGETABLE MATTER.
3. HAY BALES SHALL BE EMBEDDED IN THE SOIL A MINIMUM OF 4" AND WHERE POSSIBLE 1/2 THE HEIGHT OF THE BALE.
4. HAY BALES SHALL BE PLACED IN A ROW WITH ENDS TIGHTLY ABUTTING THE ADJACENT BALES. THE BALES SHALL BE PLACED WITH BINDINGS PARALLEL TO THE GROUND.
5. HAY BALES SHALL BE SECURELY ANCHORED IN PLACE WITH 3/8" DIA. REBAR OR 2" X 2" WOOD STAKES, DRIVEN THROUGH THE BALES. THE FIRST STAKE SHALL BE ANGLED TOWARDS THE PREVIOUSLY LAID BALE TO FORCE THE BALES TOGETHER.
6. THE GUIDELINES SHOWN HEREON ARE SUGGESTIONS ONLY AND MAY BE MODIFIED BY THE ENGINEER.

BALED HAY FOR EROSION CONTROL

## NOTES

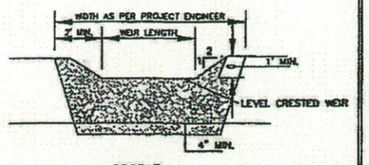
1. DETAILS PROVIDED IN PREVIOUS PERMIT, DATED APRIL 2002, BY MORENO CARDENAS, INC., SIGNED BY ROBERTO MORENO, P.E.



GENERAL NOTES:

1. SOIL USED IN BERM CONSTRUCTION SHALL BE MACHINE COMPACTED.
2. TOP WIDTH AND HEIGHT OF BERM MAY BE MODIFIED WITH PRIOR APPROVAL OF THE ENGINEER.
3. SIDE SLOPES WITHIN THE SAFETY CLEAR ZONE OF A ROADWAY SHALL BE 6:1 OR FLATTER.
4. GRADING SHALL BE SHOWN ELSEWHERE IN THE PLANS OR AS DIRECTED BY THE ENGINEER.
5. THE ENGINEER RESERVES THE RIGHT TO MODIFY THE DIMENSIONS SHOWN FOR THE BERM DEPENDENT ON RUNOFF VOLUME CHARACTERISTICS.
6. BERM THAT ARE IN PLACE FOR MORE THAN 14 CALENDAR DAYS SHOULD BE STABILIZED TO PREVENT SEDIMENT RUNOFF.
7. THE GUIDELINES SHOWN HEREON ARE SUGGESTIONS ONLY AND MAY BE MODIFIED BY THE ENGINEER.

TYPICAL BERM CONFIGURATION



PROFILE

ROCK FILTER DAM USAGE GUIDELINES

ROCK FILTER DAMS SHOULD BE CONSTRUCTED DOWNSTREAM FROM DISTURBED AREAS TO INTERCEPT SEDIMENT FROM OVERLAND RUNOFF AND/OR CONCENTRATED FLOW. THE DAMS SHOULD BE SIZED TO FILTER A MAXIMUM FLOW THROUGH RATE OF 40 GPM/FT$^2$ OF CROSS SECTIONAL AREA. A 2 YEAR STORM FREQUENCY MAY BE USED TO CALCULATE THE FLOW RATE.

TYPE 1 (18" HIGH WITH NO WIRE MESH): TYPE 1 MAY BE USED AT THE TOE OF SLOPES, AROUND INLETS, IN SMALL DITCHES, AND AT DIKE OR SWALE OUTLETS. THIS TYPE OF DAM IS RECOMMENDED TO CONTROL EROSION FROM A DRAINAGE AREA OF 5 ACRES OR LESS. TYPE 1 MAY NOT BE USED IN CONCENTRATED HIGH VELOCITY FLOWS (APPROX. 8 FT/SEC OR MORE) IN WHICH AGGREGATE WASH OUT MAY OCCUR. SANDBAGS MAY BE USED AT THE EMBEDDED FOUNDATION (4" DEEP MIN.) FOR BETTER FILTERING EFFICIENCY OF LOW FLOWS IF CALLED FOR ON THE PLANS OR DIRECTED BY THE ENGINEER.

TYPE 2 (18" HIGH WITH WIRE MESH): TYPE 2 MAY BE USED IN DITCHES AND AT DIKE OR SWALE OUTLETS.

TYPE 3 (36" HIGH WITH WIRE MESH): TYPE 3 MAY BE USED IN STREAM FLOW AND SHOULD BE SECURED TO THE STREAM BED.

TYPE 4 (SACK GABIONS): TYPE 4 MAY BE USED IN DITCHES AND SMALLER CHANNELS TO FORM AN EROSION CONTROL DAM.

*EXPLANATION OF ZONE DESIGNATIONS

| ZONE | EXPLANATION |
|---|---|
| A | Areas of 100-year flood; base flood elevations and flood hazard factors not determined. |
| AO | Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; average depths of inundation are shown, but no flood hazard factors are determined. |
| AH | Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; base flood elevations are shown, but no flood hazard factors are determined. |
| A1-A30 | Areas of 100-year flood; base flood elevations and flood hazard factors determined. |
| A99 | Areas of 100-year flood to be protected by flood protection system under construction; base flood elevations and flood hazard factors not determined. |
| B | Areas between limits of the 100-year flood and 500-year flood; or certain areas subject to 100-year flooding with average depths less than one (1) foot or where the contributing drainage area is less than one square mile; or areas protected by levees from the base flood. (Medium shading) |
| C | Areas of minimal flooding. (No shading) |
| D | Areas of undetermined, but possible, flood hazards. |
| V | Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors not determined. |
| V1-V30 | Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors determined. |

NOTES TO USER

Certain areas not in the special flood hazard areas (Zones A and V) may be protected by flood control structures.

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all planimetric features outside special flood hazard areas. The coastal flooding elevations shown were derived from those developed by the National Weather Service for hurricane evacuation planning.

For adjoining map panels, see separately printed Index to Map Panels.

## Memorandum

To: TCEQ

From: Cami Van Abel, P.E.

Subject: Appendix 3E, Sheet C13

Date: March 15, 2013

Sheet C13 prepared by Moreno Cardenas and dated October 22, 2012 is provided to provide the drainage area runoff computations and retention pond computations for the site facility improvements. The calculations provided are current to the site facility improvements.

SAIC Energy, Environment & Infrastructure, LLC

# Memorandum

SAIC

To: City of El Paso

From: Fred J. Doran, P.E., SAIC

Subject: AET Report of Waste Mass Stability

Date: November 22, 2011

Attached is a copy of the Report of Waste Mass Stability prepared by American Engineering Testing, Inc. (AET), dated June 1, 2011. The report was developed to:

- Estimate compression of the waste within the existing landfill due to construction of the vertical expansion;
- Recommend geosynthetic reinforcement requirements to be incorporated into the cover design at the base of the vertical landfill construction; and
- Perform waste mass stability analyses of the new landfill construction.

It should be noted that when determining the settlement of the existing waste, AET estimated that the age of the existing in place waste was 8 years old. This number was used as the last waste placed within the area was approximately 8 years ago. This assumption of the waste age is very conservative, as a large portion of the waste would be older than 8 years, and therefore will have gone through more settlement prior to placement of the new waste. Additionally, AET assumed that the C&D waste placed prior to MSW was all new waste, and did not consider the C&D as a surcharge in their analyses. This is also a conservative way to do the analyses. Using the two above conservative assumptions, AET estimated that the existing waste would settle anywhere from 5.5 – 17.6 feet (Appendix B of the AET report).

Based on AET's findings, they recommend using two layers of uniaxial geogrid placed perpendicular to each other for the geosynthetic reinforcement on top of the existing waste mass. The suggested product is a Fortrac 80MP (see attached for a specification sheet). Additionally, AET recommends a minimum of 6 inches of sand to underlay the geogrid.

For the waste mass stability, AET "anticipates that the planned landfill configuration should be stable, provided that no excess pore pressures are generated within the waste or that there is no increase in piezometric head above 1 foot within the underlying sand liner cover."

HUESKER
Engineering with Geosynthetics

# Fortrac® 80MP

Huesker's Fortrac 80MP geogrid is comprised of high tenacity polyvinyl alcohol (PVA) yarns crafted into a stable interlocked pattern then coated for protection from installation damage and short term ultraviolet exposure. Fortrac geogrids are easy to install, unaffected by freeze-thaw conditions and naturally occurring chemical/biological environments. Fortrac is utilized as a tensile element in retaining wall, steepened slope and void bridging applications. Fortrac geogrids are produced at Huesker's manufacturing facility which has achieved ISO 9001 approval for its systematic approach to quality in development, manufacture, inspection, sales and application support for geosynthetic materials. Huesker's ISO 9001 certificate is available upon request.

## 1.0 INTRODUCTION

This report presents the results of our geotechnical review concerning waste mass stability, settlement predictions, and reinforcement recommendations for the landfill expansion of the McCombs Landfill near El Paso, Texas.

## 2.0 SCOPE OF SERVICES

AET's services were performed according to your Purchase Order Number P500115201, dated May 12, 2011. The authorized scope consists of the following:

- Estimate compression of the waste within the existing landfill due to construction of the new vertical expansion.
- Recommend geosynthetic reinforcement requirements to be incorporated into the cover design at the base of the vertical landfill construction
- Perform waste mass stability analyses of the new landfill construction.

## 3.0 PROJECT INFORMATION

The McCombs Landfill is planning to expand the existing municipal solid waste (MSW) landfill. The existing landfill has not received any new MSW since 2003. The landfill expansion will have dimensions of approximately 4,200 feet (north-south) and 2,900 feet (east-west). The new waste will be piggybacked onto the existing MSW refuse. Prior to receiving the MSW refuse, an approximately 25-foot to 55-foot thickness of construction and demolition (C&D) debris will be placed over the existing MSW waste. The maximum final landfill height will be about 270 feet above the proposed subgrade elevation, with a maximum thickness of new MSW/new C&D refuse above the existing MSW refuse on the order of 190 feet. The final landfill side slopes will be at a maximum of 3(H):1(V).

Project information for the specific analyses we performed are presented in the following sections. The stated information represents our understanding of the proposed construction. This information is an integral part of our engineering review. It is important that you contact us if there are changes from that described so that we can evaluate whether modifications to our recommendations are appropriate.

## 4.0 VERTICAL LANDFILL EXPANSION

### 4.1 Settlement of Existing Waste

According to conventional consolidation theory, the area-wide compression settlement of municipal solid waste (MSW) when subjected to the weight of the vertical expansion can be the total of two components: primary settlement and secondary settlement. No specific testing was authorized to evaluate the necessary settlement properties of the waste, therefore the following parameters, based on published information (1)(2), were assumed for our calculations.

- Unit weight of new waste = 65 pcf
- Unit weight of existing waste = 65 pcf
- Modified primary compression index, $C_c$', of existing waste = 0.17 to 0.36
- Modified secondary compression index, $C_\alpha$', of existing waste = 0.03 to 0.10
- Age of existing waste = 8 years
- Ending time of secondary settlement = 58 years

For our analyses, we used procedures described in (1), and we also used the geometry from the cross-sections presented on the following SAIC drawings:

- Drawing Number P3-22.0, Typical Landfill Section B, dated 4/13/2011.
- Drawing Number P3-25.0, Typical Landfill Section E, dated 4/13/2011.

Copies of these sections are attached. Our settlement estimates due to the compression of the existing waste from the weight of the new, overlying waste are presented in Tables B-1 and B-2 (Appendix B) for varying primary and secondary compression indices. Please note that this does not include any immediate or consolidation settlement of the foundation soils due to the weight of the overlying landfill material.

Landfill settlements can be minimized by pretreating the landfill wastes. Pretreatment could be performed by deep dynamic compaction (DDC) or by preloading by surcharge. DDC is carried out by dropping a heavy compaction weight repeatedly at each impact location which compresses the waste. It may also be possible to pre-compress (surcharge) the existing waste by temporarily stockpiling soil from the expansion on top of the existing closed landfill, if there is sufficient time and available surcharge soil. In our judgment, this could be effective in reducing some of the anticipated primary settlement, depending on the thickness of the surcharge and duration. If you elect to surcharge this area, we suggest placing settlement instrumentation on top of the existing landfill prior to surcharge fill placement. The settlement instrumentation should then be read periodically to evaluate the effectiveness of the surcharge program.

### 4.2 Reinforcement Design

The planned piggyback liner profile to be constructed over the top of the C&D waste will consist of (from bottom upwards) 36 inches of compacted clay "buffer soil," a 6-inch thickness of compacted clay "interim cover soil," a geogrid stabilization layer, a geosynthetic clay liner (GCL), a 60 mil HDPE geomembrane, and 2 feet of drainage sand. The municipal solid waste (MSW) will be placed directly on the sand layer.

Our design of the geosynthetic reinforcement follows the procedure described in (1), and is

based on the scenario that a void develops, or is located, immediately underneath the liner. The liner is then assumed to bridge over the void, carrying the load from the proposed overlying waste. The "rusted refrigerator" scenario is used, with the design depression having a radius of 3 feet. Other assumptions are listed below and in Tables 4.2-1 and 4.2-2.

- Design life of 50 years
- Maximum height of MSW on the lining system is 190 feet

**TABLE 4.2-1 ASSUMED MATERIAL PROPERTIES**

| Material | Unit Weight (pcf) | Friction Angle (deg.) | Cohesion (psf) |
|---|---|---|---|
| MSW | 65 | 25 | 0 |
| Bedding Sand | 120 | 30 | 0 |

**TABLE 4.2-2 ASSUMED GEOSYNTHETIC PROPERTIES**

| Material | Yield Strain (%) |
|---|---|
| HDPE | 10% |
| GCL | 8% |

Based on our analyses, we recommend that the geosynthetic reinforcement consist of two layers of chemically resistant uniaxial geogrid placed perpendicular to each other. The geogrid should have a minimum design tensile strength of 3500 pounds per foot at an allowable stress of 5%, or less over the 50 year design life. The geogrid should be placed on top of a minimum 6 inch thick bedding layer of free-draining sand placed between the existing clay cap and the new GCL. Based on our conversations with a representative of Huesker (Tel. 1-512-266-3790), a geogrid such as Fortrac® 80MP would be suitable in this application. Please note that the inclusion of geogrid reinforcement is intended to reduce, but not eliminate, the probability of failure.

## 5.0 WASTE MASS STABILITY

### 5.1 Background Information

The liner system for the new expansion will consist of a 6-inch thick layer of compacted native soil covered by a 6-inch thick compacted caliche layer or as an alternative, a geosynthetic clay liner (GCL). A 60 mil HDPE geomembrane will be placed on the GCL, and will be anchored within trenches at the top of the slope. The geomembrane will be textured on both sides. A 2-foot thick sand layer will be placed over the HDPE geomembrane.

We evaluated the deep-seated stability of the waste by performing two-dimensional, effective stress slope stability analyses for the final, closed geometry, using the computer program GSLOPE Version 5.10. This program performs a limit equilibrium analysis for potential mass failure along assumed failure surfaces. For our analyses, we assumed potential failure of the waste material occurring within the waste or along the top of the HDPE liner for the deep-seated failures. Our scope does not included analyzing potential failure of, or through the HDPE liner, through the C&D waste or existing waste, the adequacy of the anchor trench design system, or stability of the underlying soil/GCL, or stability of interim slopes.

For our analyses, we used the geometry from the cross-sections presented on the following SAIC drawings:

- Drawing Number P3-21.0, "Typical Landfill Section A" dated 4/13/2011
- Drawing Number P3-22.0, "Typical Landfill Section B" dated 4/13/2011
- Drawing Number P3-25.0, "Typical Landfill Section E" dated 4/13/2011

Copies of these sections are presented in Appendix A.

### 5.2 Assumed Parameters

No new laboratory testing has been authorized as part of this work. The analyses are to be based on assumed or published strength and interface friction values for the sand and HDPE geomembrane. It is important that our assumed parameters are confirmed by specific testing prior to construction.

Due to the high variability of municipal waste, conventional *in situ* testing or laboratory testing to evaluate the engineering properties of the waste is not practical. Therefore, for our analyses we used published and assumed estimated effective stress values of shear strength, cohesion, and unit weight for municipal solid waste (2)(3). The engineering properties used in our analyses are presented in Table C-1 (Appendix C).

### 5.3 Analysis and Results

We analyzed potential circular failure surfaces and potential block or sliding failure surfaces. Our analyses assume that no more than one foot of head will develop within the sand drainage layer. We also assume that excess pore pressure will not develop within the waste either through hydrostatic pressure or gas pressure. The development of excess pore pressure would substantially reduce the factor of safety for stability. The results of our stability analyses using peak strength values are attached and are summarized in Table C-2 (Appendix C).

Due to the potential for variability of the engineering properties of the waste, we also performed a limited sensitivity analysis by evaluating the effect on the factor of safety by varying the strength parameters. The results of this limited sensitivity analysis are presented in Table C-3.

To address the potential for progressive failure, we also performed a secondary stability analysis

using assumed large displacement interface shear strengths. The results of this analysis are presented in Table C-4.

### 5.4 Conclusions

The calculated factor of safety for the peak displacement conditions exceeded 1.5 for our assumed strength and unit weight parameters, the analyzed cross sections, and assumed failure geometry. In addition, the calculated factor of safety for the large displacement condition exceeds 1.3, which in our judgment, and based on published information, is acceptable.

The results of the limited sensitivity analysis indicates a factor of safety of at least 1.89 with respect to deep seated wedge failure. Please note that the calculated factor of safety of 1.46 shown for the circular analyses is not for deep seated failure, but rather a reflection of potential near surface failure, and is due to the lack of cohesion in the analysis which is needed for deep seated circular failure analysis.

Based on our results, in our opinion, we anticipate that the planned landfill configuration should be stable, provided that no excess pore pressures are generated within the waste or that there is no increase in piezometric head above 1 foot within the underlying sand liner cover. The generation of pore pressures and increase in piezometric head within these materials will substantially reduce the factor of safety and increase the risk for stability problems

To reduce the potential for the development of excess pore pressures and piezometric head within the waste, we strongly recommend that the intermediate cover soils be sufficiently permeable so that as the height of the waste increases, the leachate does not become ponded on the underlying buried cover layers. That is, leachate should be allowed to permeate through the buried cover soils down to the underlying sand leachate collection system. If the permeability of

the intermediate cover soils is low and will not allow the rapid transmission of the leachate through the buried cover soils, then the intermediate cover soils should be breached by excavating trenches through the cover soils prior to continued waste placement to allow the leachate to permeate through down to the leachate collection system.

We strongly recommend that laboratory testing be performed using the specific HDPE liner material chosen for the project to confirm our assumed interface friction values used in our analyses. Additional stability analyses may also be required at that time.

## 6.0 LIMITATIONS

Within the limitations of scope, budget, and schedule, we have endeavored to provide our services according to generally accepted geotechnical engineering practices at this time and location. Other than this, no warranty, either express or implied, is intended.

# Appendix D

Geotechnical Report Limitations and Guidelines for Use

# Appendix D
# Geotechnical Report Limitations and Guidelines for Use
# Report No. 01-05106

## B.1 REFERENCE

This appendix provides information to help you manage your risks relating to subsurface problems which are caused by construction delays, cost overruns, claims, and disputes. This information was developed and provided by ASFE[1], of which, we are a member firm.

## B.2 RISK MANAGEMENT INFORMATION

### B.2.1 Geotechnical Services are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical engineering study conducted for a civil engineer may not fulfill the needs of a construction contractor or even another civil engineer. Because each geotechnical engineering study is unique, each geotechnical engineering report is unique, prepared solely for the client. No one except you should rely on your geotechnical engineering report without first conferring with the geotechnical engineer who prepared it. And no one, not even you, should apply the report for any purpose or project except the one originally contemplated.

### B.2.2 Read the Full Report

Serious problems have occurred because those relying on a geotechnical engineering report did not read it all. Do not rely on an executive summary. Do not read selected elements only.

### B.2.3 A Geotechnical Engineering Report is Based on A Unique Set of Project-Specific Factors

Geotechnical engineers consider a number of unique, project-specific factors when establishing the scope of a study. Typically factors include: the client's goals, objectives, and risk management preferences; the general nature of the structure involved, its size, and configuration; the location of the structure on the site; and other planned or existing site improvements, such as access roads, parking lots, and underground utilities. Unless the geotechnical engineer who conducted the study specifically indicates otherwise, do not rely on a geotechnical engineering report that was:

- not prepared for you,
- not prepared for your project,
- not prepared for the specific site explored, or
- completed before important project changes were made.

Typical changes that can erode the reliability of an existing geotechnical engineering report include those that affect:

- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light industrial plant to a refrigerated warehouse,
- elevation, configuration, location, orientation, or weight of the proposed structure,
- composition of the design team, or
- project ownership.

As a general rule, always inform your geotechnical engineer of project changes, even minor ones, and request an assessment of their impact. Geotechnical engineers cannot accept responsibility or liability for problems that occur because their reports do not consider developments of which they were not informed.

### B.2.4 Subsurface Conditions Can Change

A geotechnical engineering report is based on conditions that existed at the time the study was performed. Do not rely on a geotechnical engineering report whose adequacy may have been affected by: the passage of time; by man-made events, such as construction on or adjacent to the site; or by natural events, such as floods, earthquakes, or groundwater fluctuations. Always contact the geotechnical engineer before applying the report to determine if it is still reliable. A minor amount of additional testing or analysis could prevent major problems.

1 ASFE, 8811 Colesville Road/Suite G106, Silver Spring, MD 20910
Telephone: 301/565-2733: www.asfe.org

**B.2.5 Most Geotechnical Findings Are Professional Opinions**
Site exploration identified subsurface conditions only at those points where subsurface tests are conducted or samples are taken. Geotechnical engineers review field and laboratory data and then apply their professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ, sometimes significantly, from those indicated in your report. Retaining the geotechnical engineer who developed your report to provide construction observation is the most effective method of managing the risks associated with unanticipated conditions.

**B.2.6 A Report's Recommendations Are Not Final**
Do not overrely on the construction recommendations included in your report. Those recommendations are not final, because geotechnical engineers develop them principally from judgment and opinion. Geotechnical engineers can finalize their recommendations only by observing actual subsurface conditions revealed during construction. The geotechnical engineer who developed your report cannot assume responsibility or liability for the report's recommendations if that engineer does not perform construction observation.

**B.2.7 A Geotechnical Engineering Report Is Subject to Misinterpretation**
Other design team members' misinterpretation of geotechnical engineering reports has resulted in costly problems. Lower that risk by having your geotechnical engineer confer with appropriate members of the design team after submitting the report. Also retain your geotechnical engineer to review pertinent elements of the design team's plans and specifications. Contractors can also misinterpret a geotechnical engineering report. Reduce that risk by having your geotechnical engineer participate in prebid and preconstruction conferences, and by providing construction observation.

**B.2.8 Do Not Redraw the Engineer's Logs**
Geotechnical engineers prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in a geotechnical engineering report should never be redrawn for inclusion in architectural or other design drawings. Only photographic or electronic reproduction is acceptable, but recognizes that separating logs from the report can elevate risk.

**B.2.9 Give Contractors a Complete Report and Guidance**
Some owners and design professionals mistakenly believe they can make contractors liable for unanticipated subsurface conditions by limiting what they provide for bid preparation. To help prevent costly problems, give contractors the complete geotechnical engineering report, but preface it with a clearly written letter of transmittal. In the letter, advise contractors that the report was not prepared for purposes of bid development and that the report's accuracy is limited; encourage them to confer with the geotechnical engineer who prepared the report (a modest fee may be required) and/or to conduct additional study to obtain the specific types of information they need or prefer. A prebid conference can also be valuable. Be sure contractors have sufficient time to perform additional study. Only then might you be in a position to give contractors the best information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions.

**B.2.10 Read Responsibility Provisions Closely**
Some clients, design professionals, and contractors do not recognize that geotechnical engineering is far less exact than other engineering disciplines. This lack of understanding has created unrealistic expectations that have led to disappointments, claims, and disputes. To help reduce the risk of such outcomes, geotechnical engineers commonly include a variety of explanatory provisions in their report. Sometimes labeled "limitations" many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. Read these provisions closely. Ask questions. Your geotechnical engineer should respond fully and frankly.

**B.2.11 Geoenvironmental Concerns Are Not Covered**
The equipment, techniques, and personnel used to perform a geoenvironmental study differ significantly from those used to perform a geotechnical study. For that reason, a geotechnical engineering report does not usually relate any geoenvironmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. Unanticipated environmental problems have led to numerous project failures. If you have not yet obtained your own geoenvironmental information, ask your geotechnical consultant for risk management guidance. Do not rely on an environmental report prepared for someone else.

## Memorandum

To: TCEQ

From: Fred J. Doran, P.E., SAIC

Subject: AET Report of Supplemental Geotechnical Evaluation and Anchor Trench Stability Calculations

Date: November 2, 2012

Attached is a copy of the Supplemental Geotechnical Evaluation prepared by American Engineering Testing, Inc. (AET), dated August 3, 2012. The report was developed to supplement the original report titled "Report of Waste Mass Stability, McCombs Landfill Expansion, El Paso, Texas". Furthermore, this report includes the following analyses and results (some results taken verbatim from the report):

- Perform a waste mass stability analysis that includes the proposed C&D waste and the existing municipal solid waste;
  - Minimum factor of safety utilizing peak strength values is greater than 1.5. Additionally, a limited sensitivity analysis was completed by varying the strength parameters. Results indicate a factor of safety ranging from 1.47 to 2.78 (acceptable).
- Perform a waste mass stability of interim slopes;
  - Waste mass stability was completed for interim slopes at a 3H:1V slope at a maximum length of 270 feet. The factor of safety using peak strength parameters was 2.64 (circular failure) and 2.42 (block failure). The factor of safety assuming large displacement strength parameters was 1.60 (circular failure) and 1.76 (block failure).
- Evaluate stability and settlement of the final cover (both prescriptive and alternative);
  - Veneer Stability for Prescriptive Cover: 1.33 with parallel seepage and 1.61 for gravity conditions only.
    - The calculations for veneer stability with a factor of safety of 1.33 were calculated using a 28° internal friction angle of the erosion layer (drainage layer consisting of sand) and a saturated depth of 0.49 feet (Appendix 3I, Attachment 2, Page 104: peak daily value for maximum head on top of layer 3 equals 5.85 inches, or 0.49 feet).
    - In order to obtain a factor of safety of 1.5, the internal friction angle of the erosion layer (drainage layer consisting of sand) needs to be 31°. Published values for the internal friction angle of sand are 26° - 40° and should be readily obtainable from the material onsite. As shown on the drawings provided in Appendix 3F – Landfill Cross Sections, the boring logs for the area consist predominately of sand. The sand onsite will be tested prior to use to ensure that the internal friction angle is 31°. In the event that the

SAIC Energy, Environment & Infrastructure, LLC
1380 Corporate Center Curve, Suite 305 | St. Paul, MN 55121 | tel: 651.994.8415 | fax: 651.994.8396 | saic.com/EEandI

friction angle is unobtainable with onsite soil, alternative off-site sources will be located to provide for an erosion layer soil with the required internal friction angle.

- Veneer Stability for Alternative Cover: 1.41 for no water flow.
  - An internal friction angle of 25° was utilized to calculate the factor of safety of 1.41.
  - An internal friction angle of 27° for the sand is required to increase the factor of safety to 1.5 for the no flow conditions. Soils testing will be completed prior to construction to ensure that the internal friction angle of the sand is at least 27° to ensure the 1.5 factor of safety (which should be readily obtainable as described above). Furthermore, it should be noted that the parallel seepage analysis completed by AET does not apply to the alternative cover system as there is no saturation depth for the alternative cover. The alternative cover is designed so that a zone of saturation will never be established as the water entering will be countered by evapotranspiration.

- Evaluate final cover settlement and strain;
  - Analyses completed in initial report. In summary, the maximum tensile strain calculated in the final cover is less than 0.01%, with most values less than zero (compression). Published information indicates that LLDPE can generally be assumed to have a yield strain on the order of 12% or more. The calculated tensile strain should not adversely affect the final cover material.
- Evaluate piggyback liner settlement and strain;
  - Analyses completed in initial report. In summary, the maximum tensile strain calculated is 0.206%. Published information indicates that HDPE can generally be assumed to have a yield strain in excess of 12% and GCL can generally be assumed to have a yield strain of 1% to 10%. The geogrid will have an allowable strain of 5%. The calculated tensile strain should not adversely affect the piggyback liner materials.
- Evaluate settlement of the foundation soils; and
  - The foundation settlement is estimated to be less than one foot, and the strain is estimated to be 0.03% or less. This amount of settlement and strain should not adversely affect the existing HDPE liner.
- Perform a preliminary review of our stability analyses with respect to seismic stability.
  - Although not required for a vertical expansion of Landfills, AET performed a preliminary review of the stability analyses with respect to seismic stability. Results are included here within.

*SAIC Energy, Environment & Infrastructure, LLC*
*1380 Corporate Center Curve, Suite 305 | St. Paul, MN 55121 | tel: 651.994.8415 | fax: 651.994.8396 | saic.com/EEandI*

Additionally, anchor trench stability calculations with regards to pullout and the interface liner system stability for gravity and equipment conditions were completed by SAIC and are included in Appendix 3G, Attachment 3. Results indicate the following factors of safety:

- Anchor trench pullout versus tear: 1.10
  - The anchor trench was designed with both constructability and strength in mind. The anchor trench should fail and pullout rather than the sideslope geomembrane liner failing and tearing, since it will be easier to observe and repair an anchor trench failure. However, the anchor trench also has to aid in construction, and providing a shallower anchor trench may have issues with wind and water migration under the liner edge. The calculated factor of safety of 1.1 is considered adequate as it shows that anchor trench pullout will be the governing failure mode. Also note that the configuration is temporary as the slope will be filled against after phase construction.
- Interface liner system stability (gravity): 1.37
  - The interface liner system stability calculations are also most critical during and immediately after phase construction (until waste filling begins within the phase) and are a temporary condition. As waste is filled against the slope, the waste creates a buttress to provide more strength against failure. The calculated 1.37 factor of safety is considered adequate for temporary conditions.
- Interface liner system stability (equipment): 1.31 and 1.36
  - As described above, the calculated factors of safety are for temporary conditions during phase construction and are considered adequate.

It should be noted that all construction materials should be tested prior to use to ensure compliance with these calculations. If materials do not meet the requirements specified, analysis should be recompleted for the actual material properties.

All recommendations within the AET Report dated August 3, 2012 will be implemented in full upon permit amendment approval.

Attn: Mr. Fred Doran, PE

RE: Supplemental Geotechnical Evaluation
McCombs Landfill Expansion
El Paso, Texas
AET Report No. 01-05106

Dear Mr. Doran:

This report presents the results of our supplemental geotechnical evaluation for the referenced project. We are submitting an electronic copy and three hard copies of the report to you. This work was performed in accordance with our proposal to you dated May 2, 2012, which was authorized by your Purchase Order No. P500115201, dated May 12, 2012. This report is a supplement to our original report to you titled *Report of Waste Mass Stability, McCombs Landfill Expansion, El Paso, Texas*, dated June 1, 2011, and addresses comments you received from the Texas Commission on Environmental Quality (TCEQ).

## 1.0 Scope of Supplemental Services

Our scope of services for this supplemental evaluation consists of the following items:

1. Perform a waste mass stability analysis that includes the proposed C&D waste and the existing municipal solid waste
2. Perform a waste mass stability of interim slopes
3. Evaluate stability and settlement of the final and alternate covers
4. Evaluate settlement of the foundation soils
5. Perform a preliminary review of our stability analyses with respect to seismic stability

## 2.0 Supplemental Waste Mass Stability Analyses

### *2.1 Discussion*

We evaluated the deep-seated stability by performing two-dimensional, effective stress slope stability analyses for the final, closed geometry, using the computer program *GSLOPE Version 5.10*. This program performs a limit equilibrium analysis for potential mass failure along assumed failure surfaces. We assumed that the failure surfaces extend through the new waste, and into the underlying C&D waste and existing MSW waste. For our analyses, we used the geometry from the cross-sections presented on the following SAIC drawings:

550 Cleveland Avenue North | St. Paul, MN 55114
Phone 651-659-9001 | Toll Free 800-972-6364 | Fax 651-659-1379 | www.amengtest.com | AA/EEO
This document shall not be reproduced, except in full, without written approval from American Engineering Testing, Inc.

- Drawing Number P3-20.0, "Typical Landfill Section B" dated 11/22/2011
- Drawing Number P3-23.0, "Typical Landfill Section E" dated 11/22/2011

Copies of these sections are attached in Appendix A. We understand that the final cover for the existing MSW landfill, below the new C&D waste, will consist of 3 feet of soil with no geosynthetics. We assume that this soil will be sand. We also assumed that there is a textured HDPE liner beneath the existing MSW landfill.

Due to the high variability of municipal waste, conventional *in situ* testing or laboratory testing to evaluate the engineering properties of the waste is not practical. There is no data available concerning the engineering properties of the new MSW waste, the C&D waste, the asbestos fill, and the existing MSW waste. Therefore, for our analyses we used published and assumed estimated effective stress values of shear strength, cohesion, and unit weight for municipal solid waste (Eid, et al, 2000, Singh and Murphy 1990), and we also used these same values for the C&D waste, asbestos fill, and the existing MSW waste. Please contact us if specific shear strength and unit weight data become available, and we can then re-evaluate our analyses. In addition, because specific laboratory test results are not available, we have assumed engineering properties for the drainage sand ("Protective Soil Layer") and the interface friction angle between the sand the geomembrane. The engineering properties used in our analyses are presented in Table 2-1.

**TABLE 2-1 ASSUMED ENGINEERING PROPERTIES FOR ANALYSES**

| Material | Effective Friction Angle, peak $\phi$'(degrees) | Effective Friction Angle, L.D.[1] $\phi$'(degrees) | Unit Weight, $\gamma$ (pcf) | Effective Cohesion (peak), c' (psf) | Effective Cohesion (L.D.[1]), c' (psf) |
|---|---|---|---|---|---|
| New and Existing MSW, New C&D Waste, Asbestos Fill | 35° | 28° | 65 | 525 | 0 |
| Drainage Sand | 29° | 29° | 110 | 0 | 0 |
| Interface between Sand/textured HDPE or LLDPE | 30° | 25° | N/A | 0 | 0 |

1: Large Displacement

### *2.2 Waste Mass Stability*

We analyzed potential circular failure surfaces and potential block (sliding) failure surfaces at Sections B and E. We assume that excess pore pressure will not develop within the waste either through hydrostatic pressure or gas pressure. The development of excess pore pressure would substantially reduce the factor of safety for stability. The results of our stability analyses using

peak strength values are presented in Appendix B. In summary, the minimum factor of safety is greater than 1.5, and in our judgment, is acceptable.

Due to the potential for variability of the engineering properties of the waste, we also performed a limited sensitivity analysis by evaluating the effect on the factor of safety by varying the strength parameters. The shear strength parameters used are presented in Table C-3 of our original report. The results of this limited sensitivity analysis are presented in attached Appendix B. The results indicate a factor of safety ranging from 1.47 to 2.78. In our judgment, these are acceptable.

To address the potential for progressive failure, we also performed an additional stability analysis using the assumed large displacement interface shear strengths presented in Table 2-1. The results of this analysis are presented in attached Appendix B. The calculated factor of safeties are in excess of 1.5, and in our judgment, are acceptable.

### *2.3 Interim Slopes*

We understand that interim slopes will be constructed no steeper than 3H:1V. We evaluated the interim slope waste mass stability assuming a cross section from Section E for the apparent tallest interim slope height of about 270 feet, with the waste placed on the maximum 1% sloping foundation grade. We assume that the interim waste will not be placed on slopes steeper than 1%, nor will they be constructed with a slope face steeper than 3H:1V. The results are presented in Appendix C. For the assumed peak strength parameters, the calculated factor of safety was 2.64 for a theoretical circular failure surface, and 2.42 for a theoretical block failure surface. The factor of safety assuming large displacement strength parameters was 1.60 and 1.76, respectively. In our judgment, these factor of safeties are acceptable.

## 3.0 Stability Analysis of Final and Alternate Cover Systems

We performed an "infinite" slope stability analysis to evaluate the stability of the final and alternate cover system following procedures described by Qian, et al (2002). The final cover profile consists of a 6-inch thick topsoil or 4-inch thick rock layer, a 12-inch thick erosion layer, a 40 mil textured LLDPE liner, an 18-inch thick infiltration layer, a 6-inch thick intermediate cover layer, and a 6-inch thick daily cover layer overlying the refuse. We understand that the maximum calculated head on top of the LLDPE liner within the erosion layer along the 3H:1V side slopes is 5.825 inches (0.49 feet). We assume that the erosion layer will consist of sand having less than 10% passing the No. 200 sieve.

For our analyses, we assumed a maximum slope grade of 3H:1V. We also assumed that the LLDPE liner is appropriately anchored such that there will be no slippage between this and the underlying materials. The scope of our analyses does not include an evaluation of the anchored trench design nor the adequacy of the strength of the geomembrane to prevent material rupture or creep failure. We understand that the landfill will incorporate an adequate landfill gas collection system; therefore, landfill gas pressures have not been included in the calculations. Landfill gas

pressure can substantially reduce the factor of safety. We assumed a peak interface friction angle of 28° between the LLDPE and the sand ("erosion layer") cover. We also assumed a friction angle of 29° for the sand cover soils.

The results are presented in Appendix E. The results indicate that for a no water flow condition, the calculated factor of safety is 1.61. Assuming a saturated depth of 0.49 feet within the cover soil above the LLDPE, with seepage parallel to the liner, the calculated factor of safety is 1.33 for the assumed interface friction angle between the LLDPE and the cover soil of 28°. To achieve a factor of safety of 1.5 for this seepage condition, both the interface friction angle and the internal friction angle of the sand cover soils needs to be at least 31°.

The alternate cover will consist of a 4-inch thickness of "rock armor," 18 inches of sand compacted to 90% Standard Proctor maximum dry density, and 6 inches of sand compacted to 80% Standard Proctor maximum dry density, overlying the refuse. Laboratory test results provided to us indicate that this sand has 13.7% passing the No. 200 sieve. The sand compacted to 90% has a friction angle of 25° as tested by the direct shear test. The results of our calculations are presented in Appendix E. Assuming a friction angle of 25° for both the "90% density" sand and the "80% density" sand, the results indicate that for a no water flow condition, the calculated factor of safety is 1.41. Seepage flow within the sand will lower the factor of safety. We have included a graph showing factor of safety versus saturation depth for parallel seepage, which indicates that the factor of safety drops below 1.0 for a saturation depth of about 1.25 feet.

## 4.0 Settlement Evaluation

### *4.1 Final Cover Settlement and Strain*

Our settlement evaluation for the final cover followed procedures and assumptions stated in our original report. As part of our settlement calculations we also evaluated the strain in the liner cover system, and also the anticipated change in surface grade between evaluation points. We evaluated the settlement at two cross sections; Sections B and E, as referenced in Section 2.0 of this report. The results are attached in Appendix D. In summary, the maximum tensile strain calculated is less than 0.01%, with most values less than zero (compression). Published information indicates that LLDPE can generally be assumed to have a yield strain on the order of 12%, or more; therefore, in our judgment, the calculated tensile strain should not adversely affect the LLDPE liner.

### *4.2 Piggyback Liner Settlement and Strain*

Our settlement evaluation for the piggyback liner followed procedures and assumptions stated in our original report. As part of our settlement calculations we also evaluated the strain in the piggyback liner cover system, and also the anticipated change in grade between evaluation points. We evaluated the settlement at two cross sections; Sections B and E, as referenced in Section 2.0 of this report. The results are attached in Appendix D. In summary, the maximum tensile strain calculated is 0.206%. Published information indicates that HDPE can generally be assumed to have a yield strain on the order of 12%, or more, and GCL can generally be assumed

to have a yield strain of 1% to 10%. The geogrid will have an allowable strain of 5%. Based on our results, in our judgment, the calculated tensile strain should not adversely affect these geosynthetic materials.

### *4.3 Foundation Settlement, Heave, and Strain*

Previous borings performed in the area were used to evaluate the subsurface conditions needed for estimation of foundation settlement and excavation-induced heave evaluation (see *SAIC Appendix 3K – Attachment 3, Borings*). The foundation is defined in this report as the base of the existing MSW landfill. No new borings or laboratory testing were performed for this evaluation.

The settlement analyses were made using the computer program *FoSSA 2.0*, which utilizes conventional Boussinesq stress theory. The program assesses stresses and settlements under embankments. The landfill was modeled as a two-dimensional embankment. We used elastic theory for the foundation soils and conventional consolidation theory for the different waste materials (i.e. the existing MSW, the C&D fill, and the asbestos fill).

The estimated heave of the foundation soils due excavation is plotted as estimated elastic rebound and are presented on the attached graphs in Appendix E. The amount of excavation-induced heave calculated is, in our opinion, small, generally less than about 0.25 feet.

The estimated foundation settlement due to the full MSW height are presented on the attached graphs in Appendix E. The foundation settlement is estimated to be less than one foot, and the strain is estimated to be 0.03%, or less. Published information indicates that HDPE can generally be assumed to have a yield strain on the order of 12%, or more. In our judgment, the estimated amount of settlement and strain should not adversely affect the existing HDPE liner.

## 5.0 Preliminary Seismic Stability Analyses

You indicated that originally the landfill was located outside any designated seismic impact zones at the time of the original construction; however, based on current USGS seismic maps the facility is now within a seismic impact zone that exceeds the 30 TAC §330.557 standard. A seismic impact zone is defined as an area with a 10% or greater probability that the maximum horizontal acceleration in rock will exceed 0.10g in 250 years. You explained; however, that this standard only applies to new MSW facilities and not vertical expansions as proposed. Although not specifically required, we have, however, performed a preliminary review of our stability analyses with respect to seismic stability.

According to the USGS Ground Motion Parameter Calculator, the site specific maximum seismic horizontal acceleration with a 2% probability of exceedance in 50 years (equivalent to 10% probability in 250 years) is 0.116g for a one second period. We performed a pseudo-static screening analysis following procedures described by Bray, et al (1998), and Duncan and Wright (2005). Our analysis assumed an acceleration multiplier of 0.75. The results are attached. In summary, the screening analysis for the interim slope, and waste mass stability through Section

E, resulted in a factor of safety of in excess of 1.2. The screening analysis for the final cover, assuming a large displacement interface friction angle of 25° between the LLDPE and the cover soils, and a dry condition, resulted in a factor of safety of 1.08. The calculated factor of safety for these screening analyses are greater than 1.0, and as such, permanent seismic displacements are estimated to be less than one foot.

## 6.0 Concluding Comments

No new laboratory testing has been authorized as part of this supplemental work. It is important; however, that our assumed engineering properties are confirmed by specific testing prior to construction. Apart from the typical testing required, such as Proctor tests and gradation analyses, additional testing to address the assumed parameters in this report should include, but not be limited to, the following items:

1. Final Cover System
    a. Direct shear test on the Final Cover "Erosion Layer" soil.
    b. Large-scale direct shear test to determine the interface friction angle between the "Erosion Layer" soil and the 40 mil LLDPE.
2. Alternate Cover System
    a. Direct shear test on the sand compacted to 80% of the maximum Standard Proctor dry density.
3. Piggyback Liner System
    a. Large-scale direct shear test to determine the interface friction angle between the "Protective Soil Layer" and the 60 mil HDPE.
4. Basal Permitted and Alternate Liner Systems
    a. Direct shear test on the "Protective Soil Layer."
    b. Large-scale direct shear test to determine the interface friction angle between the "Protective Soil Layer" and the 60 mil HDPE.

The geosynthetic manufacturers should also provide the allowable yield strain for all of their proposed materials.

## 7.0 Limitations

Within the limitations of scope, budget, and schedule, we have endeavored to provide our services according to generally accepted geotechnical engineering practices at this time and location. Other than this, no warranty, either express or implied, is intended.

# PREDICTED SETTLEMENT AND STRAIN OF PIGGYBACK LINER DUE TO COMPRESSION OF THE EXISTING MSW AND NEW C&D WASTE

McCombs Landfill
American Engineering Testing, Inc.
AET No. 01-05106

## Settlement of Existing Landfill

Ref. Qian, X., et. al., "Geotechnical Aspects of Landfill Design and Construction," Prentice Hall, 2002, pg. 548

**Project:** McCombs Landfill **AET No.** 01-05106
**Section:** Section B **Date:** July 2012

### Compression of Existing MSW and New C-D

**Primary Settlement**

$\Delta Z_c = C_c' \times H_o \times \log (\sigma_o + \Delta\sigma / \sigma_o)$

$\Delta Z_c$ = primary settlement of existing landfill
$H_o$ = initial thickness of the waste layer of the existing landfill
$C_c'$ = modified primary compression index. Cc'= 0.17~0.36
$\sigma_o$ = existing overburden pressure acting at the mid level of the waste layer
$\Delta\sigma$ = increment of overburden pressure due to vertical expansion

**Secondary Settlement**

$\Delta Z_\alpha = C_\alpha' \times H_o \times \log (t2 / t1)$

$\Delta Z_\alpha$ = secondary settlement of existing landfill
$H_o$ = initial thickness of the waste layer before starting secondary settlement
$C_\alpha'$ = modified secondary compression index. $C_\alpha'$ = 0.03~0.1
t1 = starting time of the secondary settlement. It is assumed to be equal to the age of existing landfill
t2 = ending time of the secondary settlement

**Enter Assumed Parameters**

| | | | |
|---|---|---|---|
| Cc' = | 0.17 | t1 = | 9 |
| Ca' = | 0.03 | t2 = | 59 |
| Unit Weight of existing waste (pcf) = | 65 | | |
| Unit Weight of new waste (pcf) = | 65 | | |

### Settlement of Existing MSW and New C-D

**Primary Settlement**

$\Delta Z_c = C_c' \times H_o \times \log (\sigma_o + \Delta\sigma / \sigma_o)$

$\Delta Z_c$ = primary settlement of existing landfill
$H_o$ = initial thickness of the waste layer of the existing landfill
$C_c'$ = modified primary compression index. Cc'= 0.17~0.36
$\sigma_o$ = existing overburden pressure acting at the mid level of the waste layer
$\Delta\sigma$ = increment of overburden pressure due to vertical expansion

**Secondary Settlement**

$\Delta Z_\alpha = C_\alpha' \times H_o \times \log (t2 / t1)$

$\Delta Z_\alpha$ = secondary settlement of existing landfill
$H_o$ = initial thickness of the waste layer before starting secondary settlement
$C_\alpha'$ = modified secondary compression index. $C_\alpha'$ = 0.03~0.1
t1 = starting time of the secondary settlement. It is assumed to be equal to the age of existing landfill
t2 = ending time of the secondary settlement

**Enter Assumed Parameters**

**Date:** July 2012

### Final Cover Settlement

### Primary Settlement

$\Delta Z_c = C_c' \times H_o \times \log (\sigma_o + \Delta\sigma / \sigma_o)$

$\Delta Z_c$ = primary settlement of existing landfill
$H_o$ = initial thickness of the waste layer of the existing landfill
$C_c'$ = modified primary compression index. Cc'= 0.17~0.36
$\sigma_o$ = existing overburden pressure acting at the mid level of the waste layer
$\Delta\sigma$ = increment of overburden pressure due to vertical expansion

### Secondary Settlement

$\Delta Z_\alpha = C_\alpha' \times H_o \times \log (t2 / t1)$

$\Delta Z_\alpha$ = secondary settlement of existing landfill
$H_o$ = initial thickness of the waste layer before starting secondary settlement
$C_\alpha'$ = modified secondary compression index. $C_\alpha'$ = 0.03~0.1
t1 = starting time of the secondary settlement. It is assumed to be equal to the age of existing landfill
t2 = ending time of the secondary settlement

## Settlement of Existing Landfill

Ref. Qian, X., et. al., "Geotechnical Aspects of Landfill Design and Construction," Prentice Hall, 2002, pg. 548

**Project:** McCombs Landfill
**Section:** Section E

**AET No.** 01-05106
**Date:** July 2012

### Final Cover Settlement

### Primary Settlement

$\Delta Z_c = C_c' \times H_o \times \log (\sigma_o + \Delta\sigma / \sigma_o)$

$\Delta Z_c$ = primary settlement of existing landfill
$H_o$ = initial thickness of the waste layer of the existing landfill
$C_c'$ = modified primary compression index. Cc'= 0.17~0.36
$\sigma_o$ = existing overburden pressure acting at the mid level of the waste layer
$\Delta\sigma$ = increment of overburden pressure due to vertical expansion

### Secondary Settlement

$\Delta Z_\alpha = C_\alpha' \times H_o \times \log (t2 / t1)$

$\Delta Z_\alpha$ = secondary settlement of existing landfill
$H_o$ = initial thickness of the waste layer before starting secondary settlement
$C_\alpha'$ = modified secondary compression index. $C_\alpha'$ = 0.03~0.1
t1 = starting time of the secondary settlement. It is assumed to be equal to the age of existing landfill
t2 = ending time of the secondary settlement

### Enter Assumed Parameters

| | | | |

SAIC®

## Memorandum

To: TCEQ

From: Fred J. Doran, P.E., SAIC

Subject: Anchor Trench Design for Pullout and Interface Liner System Stability Calculations

Date: November 2, 2012

Attached is the anchor trench design for pullout and interface liner system stability calculations completed by SAIC on July 17, 2012. The calculations were completed using the references identified here within. Results indicate the following factors of safety:

- Anchor trench pullout versus tear: 1.10

The anchor trench was designed with both constructability and strength in mind. The anchor trench should fail and pullout rather than the sideslope geomembrane liner failing and tearing, since it will be easier to observe and repair an anchor trench failure. However, the anchor trench also has to aid in construction, and providing a shallower anchor trench may have issues with wind and water migration under the liner edge. The calculated factor of safety of 1.1 is considered adequate as it shows that anchor trench pullout will be the governing failure mode. Also note that the configuration is temporary as the slope will be filled against after phase construction.

- Interface liner system stability (gravity): 1.37

The interface liner system stability calculations are also most critical during and immediately after phase construction (until waste filling begins within the phase) and are a temporary condition. As waste is filled against the slope, the waste creates a buttress to provide more strength against failure. The calculated 1.37 factor of safety is considered adequate for temporary conditions.

- Interface liner system stability (equipment): 1.31 and 1.36

As described above, the calculated factors of safety are for temporary conditions during phase construction and are considered adequate.

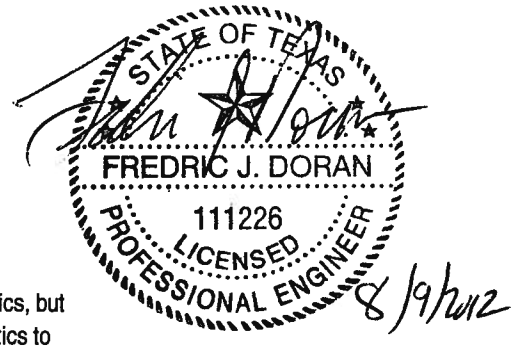
# Anchor Trench Design for Pullout
# McCombs Landfill MSW Permit 729B



Completed By: TLK 7/17/2012
Checked By: FJD 7/17/2012

*Problem Statement:*

PROBLEM: The anchor trench is designed to prevent wind and water migration under the geosynthetics, but is not designed to allow the geosynthetics to be in tension. In failure this design allows the geosynthetics to pull out of the anchor trench rather than tear.

OBJECTIVE: Determine if the designed anchor trench is adequate.

*Equation:*

**Anchor Trench Capacity = $F_U + F_L + F_{AT1} + F_{AT2} + F_{BU} + F_{BL}$**

*Where:*

| | | | |
|---|---|---|---|
| **$F_U$ =** | **0** | **lb/ft** | Frictional force above geomembrane (assumed to be negligible since cover soil likely moves with geomembrane) |
| $F_L = d_{cs} * \gamma_{cs} * L_{ro} * \tan\phi_2$ | | | |
| $d_{cs}$ = | 2 | ft | Depth of protective cover on the liner runout, design value |
| $\gamma_{cs}$ = | 110 | pcf | Unit weight of protective cover of anchor trench, assumed value |
| $L_{RO}$ = | 4 | ft | Runout length with soil cover, design value |
| $\phi_2$ = | 24 | ° | Most critical friction angle below geomembrane (woven geotextile to soil, assumed value) |
| | 0.42 | radians | |
| **$F_L$ =** | **391.58** | **lb/ft** | Calculated |
| $F_{AT1} = K_A([0.5d_{AT} * \gamma_{cc} + d_{cs} * \gamma_{cs}]d_{AT})*\tan\phi_1$ | | | |
| $K_a = \tan(45° - \phi_0/2)^2$ | | | Active coefficient of earth pressure |
| $\phi_0$ = | 30 | ° | Internal friction angle of backfill soil, assumed value |
| | 0.52 | radians | |
| $K_a$ = | 0.33 | | Calculated |
| $d_{AT}$ = | 2 | ft | Depth of ancor trench, design value |
| $\gamma_{cc}$ = | 110 | pcf | Unit weight of anchor trench backfill, assumed value |
| $d_{cs}$ = | 2 | ft | Depth of protective cover on the liner runout, design value |
| $\gamma_{cs}$ = | 110 | pcf | Unit weight of protective cover of anchor trench, assumed value |
| $\phi_1$ = | 25 | ° | Most critical friction angle above geomembrane (sand to textured geomembrane, assumed value) |
| | 0.44 | radians | |
| **$F_{AT1}$ =** | **102.4** | **lb/ft** | Calculated |
| $F_{AT2} = K_p([0.5d_{AT} * \gamma_{cc} + d_{cs} * \gamma_{cs}]d_{AT})*\tan\phi_2$ | | | |

## Interface Liner System Stability
## McCombs Landfill MSW Permit 729B
## Koerner and Soong Analysis of Liner System

| | | |
|---|---|---|
| Completed By: | TLK | 7/17/2012 |
| Checked By: | FJD | 7/17/2012 |

*Problem Statement:*

In order to determine the required tensile strength of the geosynthetics to be placed as the liner beneath the protective soil, it is necessary to calculate the tensile forces placed on the liner system. After determining the tensile forces present in the cover liner system, it would be possible to define the requirements for an anchor trench. Tensile forces have been calculated by Koerner methodologies.

## NOTES

1. CONTOURS SHOWN REPRESENT TOP OF COMPACTED NATIVE SUBGRADE SOIL IN FUTURE CELLS OR INTERIM COVER SOIL IN EXISTING CELLS.
2. BASE CONTOUR INTERVAL FOR SOLID CONTOURS IS FIVE FEET. BASE CONTOUR INTERVAL FOR DASHED CONTOURS IS ONE FOOT. ELEVATIONS ARE CITY OF EL PASO VERTICAL DATUM.
3. INTERIOR SECTOR BOUNDARY LOCATIONS FOR SECTORS B, D, E, AND F ARE CONSIDERED TO BE A MOVING TARGET AND MAY VARY DEPENDING ON THE AMOUNT OF FILL ON THE EXISTING UNLINED LANDFILL AT THE TIME OF CELL DEVELOPMENT. CURRENT INTERIOR SECTOR BOUNDARIES ARE BASED ON EXISTING CONDITIONS AS OF FEBRUARY 2011.
4. SEE DRAWING P3-28B FOR PIGGYBACK LINER LOCATIONS.

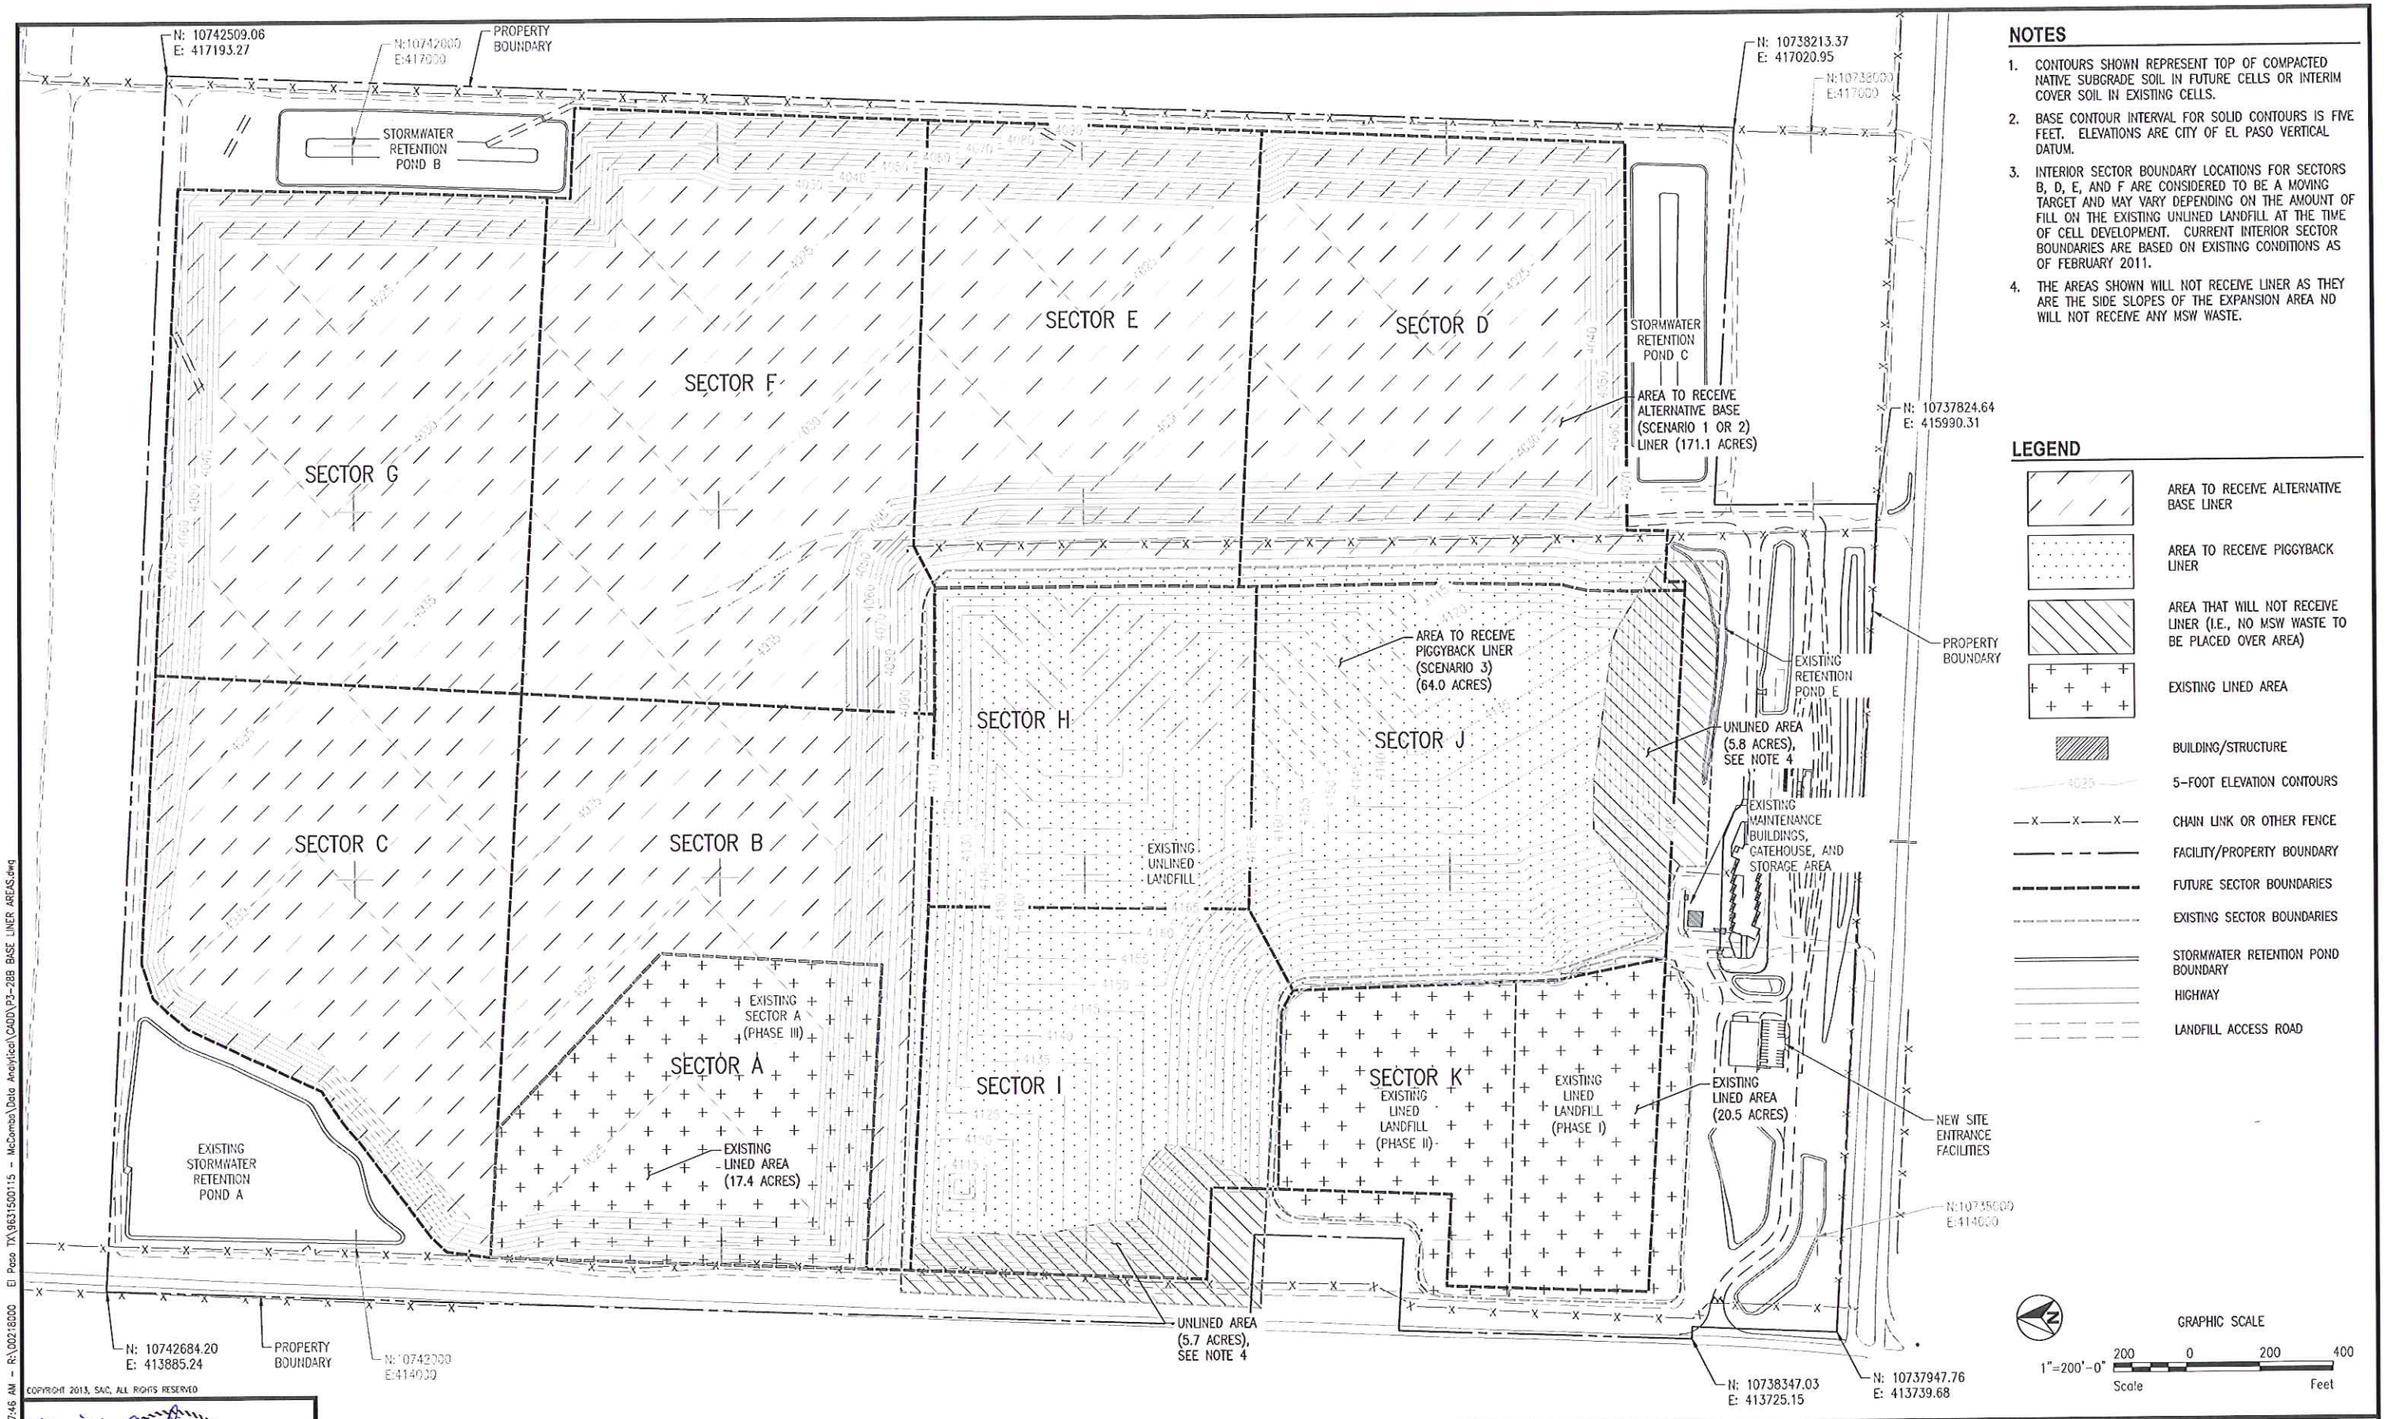
LANDFILL BASE PLAN

PROJECT NUMBER: 9631500115
SHT. 61 OF: 78
DRAWING NUMBER: P3-28



## NOTES

1. CONTOURS SHOWN REPRESENT TOP OF COMPACTED NATIVE SUBGRADE SOIL IN FUTURE CELLS OR INTERIM COVER SOIL IN EXISTING CELLS.
2. BASE CONTOUR INTERVAL FOR SOLID CONTOURS IS FIVE FEET. ELEVATIONS ARE CITY OF EL PASO VERTICAL DATUM.
3. INTERIOR SECTOR BOUNDARY LOCATIONS FOR SECTORS B, D, E, AND F ARE CONSIDERED TO BE A MOVING TARGET AND MAY VARY DEPENDING ON THE AMOUNT OF FILL ON THE EXISTING UNLINED LANDFILL AT THE TIME OF CELL DEVELOPMENT. CURRENT INTERIOR SECTOR BOUNDARIES ARE BASED ON EXISTING CONDITIONS AS OF FEBRUARY 2011.
4. THE AREAS SHOWN WILL NOT RECEIVE LINER AS THEY ARE THE SIDE SLOPES OF THE EXPANSION AREA NO WILL NOT RECEIVE ANY MSW WASTE.

## LEGEND

- AREA TO RECEIVE ALTERNATIVE BASE LINER
- AREA TO RECEIVE PIGGYBACK LINER
- AREA THAT WILL NOT RECEIVE LINER (I.E., NO MSW WASTE TO BE PLACED OVER AREA)
- EXISTING LINED AREA
- BUILDING/STRUCTURE
- 5-FOOT ELEVATION CONTOURS
- CHAIN LINK OR OTHER FENCE
- FACILITY/PROPERTY BOUNDARY
- FUTURE SECTOR BOUNDARIES
- EXISTING SECTOR BOUNDARIES
- STORMWATER RETENTION POND BOUNDARY

SAIC

To: TCEQ

From: Cami Van Abel, P.E., SAIC

Subject: Waste Mass Stability

Date: July 17, 2013

Attached is a copy of the Supplemental Geotechnical Evaulation for Waste Mass Stability prepared by American Engineering Testing (AET) dated July 17, 2013. The report was developed to update the initial waste mass stability analysis performed based on adjustments made to the final cover design and adjusting the C&D material thickness, overlain by uncontaminated soil, within the piggyback expansion area. The results of the analysis indicate a factor of safety ranging from 1.48 to 2.32, which is an acceptable range.

RE: Supplemental Geotechnical Evaluation
McCombs Landfill Expansion
El Paso, Texas
AET Project No. 01-05106

Dear Ms. Abel:

This report presents the results of your requested supplemental geotechnical evaluation for the referenced project. We are submitting an electronic copy and three hard copies of the report to you. This work was performed in accordance with our proposal to you dated July 8, 2013. This report addresses comments you received from the Texas Commission on Environmental Quality (TCEQ) requesting supplemental waste mass stability analyses due to a change in landfill materials. This report is a supplement to our original reports to you titled *Report of Waste Mass Stability, McCombs Landfill Expansion, El Paso, Texas*, dated June 1, 2011, and *Supplemental Geotechnical Evaluation, McCombs Landfill Expansion, El Paso, Texas,* dated August 3, 2012.

## 1.0 Scope of Supplemental Services

Our scope of services for this supplemental evaluation consists of the following:

- Perform a waste mass stability analysis of 2 cross-sections that includes the proposed C&D waste, the now proposed soil fill, and the existing municipal solid waste

No field or laboratory testing were performed for these supplemental analyses.

## 2.0 Supplemental Waste Mass Stability Analyses

### *2.1 Discussion*

We understand that some of the original volume reserved for future C&D waste will now be replaced with "uncontaminated soil fill." The actual soil type, however, is not known. This uncontaminated soil fill will be placed on top of the C&D waste. There will not be a liner between the two.

We evaluated the deep-seated stability by performing two-dimensional, effective stress slope stability analyses for the final, closed geometry, using the computer program *GSLOPE Version*

This document shall not be reproduced, except in full, without written approval from American Engineering Testing, Inc.

*5.10.* This program performs a limit equilibrium analysis for potential mass failure along assumed failure surfaces. We assumed that the failure surfaces extend through the new waste, and into the underlying uncontaminated soil fill, C&D waste and existing MSW waste. For our analyses, we used the geometry from the cross-sections presented on the following SAIC drawings:

- Drawing Number P3-20, "Typical Landfill Section B" dated 6/3/13
- Drawing Number P3-23, "Typical Landfill Section E" dated 6/3/13

Copies of these sections are attached in Appendix A. We understand that the final cover for the existing MSW landfill, below the new C&D waste, will consist of 3 feet of soil with no geosynthetics. We assume that this soil will be sand. We also assumed that there is a textured HDPE liner beneath the existing MSW landfill.

Due to the high variability of municipal waste, conventional *in situ* testing or laboratory testing to evaluate the engineering properties of the waste is not practical. There is no data available concerning the engineering properties of the new MSW waste, the C&D waste, the asbestos fill, and the existing MSW waste. Therefore, for our analyses we used published and assumed estimated effective stress values of shear strength, cohesion, and unit weight for municipal solid waste (Eid, et al, 2000, Singh and Murphy 1990), and we also used these same values for the C&D waste, asbestos fill, and the existing MSW waste. Please contact us if specific shear strength and unit weight data become available, and we can then re-evaluate our analyses. The type of soil to be used for the "uncontaminated soil fill" is not known. For our analyses we have assumed that this soil fill would consist of sand, and that a phreatic surface would not develop within the sand. The engineering properties used in our analyses are presented in Table A.

### *2.2 Waste Mass Stability*

We analyzed potential circular failure surfaces and potential block (sliding) failure surfaces at Sections B and E. We assume that excess pore pressure will not develop within the waste either through hydrostatic pressure or gas pressure. The development of excess pore pressure would substantially reduce the factor of safety for stability. The results of our stability analyses using peak strength values are presented in Appendix B. In summary, the minimum factor of safety is greater than 1.5, and in our judgment, is acceptable.

Due to the potential for variability of the engineering properties of the waste, we also performed a limited sensitivity analysis by evaluating the effect on the factor of safety by varying the strength parameters. The shear strength parameters used are presented in Table C-3 of our original report. The results of this limited sensitivity analysis are presented in attached Appendix B. The results indicate a factor of safety ranging from 1.48 to 2.32. In our judgment, these are acceptable.

To address the potential for progressive failure, we also performed an additional stability analysis using the assumed large displacement interface shear strengths presented in Table A. The results of this analysis are presented in attached Appendix B. The results indicate a factor of safety ranging from 1.47 to 2.12. In our judgment, these are acceptable.

**TABLE A: ASSUMED ENGINEERING PROPERTIES FOR ANALYSES**

| Material | Effective Friction Angle, peak $\phi'$(degrees) | Effective Friction Angle, L.D.[1] $\phi'$(degrees) | Unit Weight, $\gamma$ (pcf) | Effective Cohesion (peak), c' (psf) | Effective Cohesion (L.D.[1]), c' (psf) |
|---|---|---|---|---|---|
| New and Existing MSW, New C&D Waste, Asbestos Fill | 35° | 28° | 65 | 525 | 0 |
| "Uncontaminated Soil Fill" (Sand) | 29° | 29° | 125 | 0 | 0 |
| Drainage Sand | 29° | 29° | 110 | 0 | 0 |
| Interface between Sand/textured HDPE or LLDPE | 30° | 25° | N/A | 0 | 0 |

1: Large Displacement

## 3.0 Concluding Comments

No new laboratory testing has been authorized as part of this supplemental work. It is important; however, that our assumed engineering properties are confirmed by specific testing prior to construction. Apart from the typical testing required, such as Proctor tests and gradation analyses, additional testing to address the assumed parameters were presented in our August 3, 2012 report. Testing of the uncontaminated soil fill should also include classification testing and strength testing (direct shear and triaxial shear).

## 4.0 Limitations

Within the limitations of scope, budget, and schedule, we have endeavored to provide our services according to generally accepted geotechnical engineering practices at this time and location. Other than this, no warranty, either express or implied, is intended.

## 3H.1 Solid Waste Generation

The McCombs Landfill accepts waste generated in El Paso County, Texas. The Clint Landfill also accepts waste generated in El Paso County. The estimated rate of disposal was calculated assuming an annual population increase of 2% in growth, and assuming a disposal rate of 497,309 tons per year (in 2014 tonnage) until Clint Landfill closes in 2030. 3,000 tons per year are assumed from 2011 through 2013. After Clint Landfill closes, McCombs Landfill will receive all of the waste that would have previously gone to Clint Landfill, therefore the disposal rate at McCombs will raise from 45% of the county waste allocation to 100%. The 1990 base population for central, northeastern and northwestern areas of El Paso (areas where solid waste is planned to go to the McCombs Landfill) was used for the growth rate estimation. The population for the above mentioned areas in 1990 was 322,842 people.

The disposal rate for C&D waste was calculated assuming a disposal rate of 60,000 tons per year (this is the approximate tonnage of C&D disposed of at Clint Landfill 2284 in FY 2010), also with an annual increase of 2% growth.

## 3H.2 Airspace Utilization

An airspace utilization factor (AUF) of 0.60 tons per cubic yard (1200 pounds per cubic yard) of landfill airspace was utilized to calculate the site life projections for the volume available at the McCombs Landfill.

## 3H.3 Landfill Capacity

The total landfill capacity represents a total volume available for disposal of solid waste, daily cover material and intermediate cover material. AutoCAD Civil 3D 2011 computer software was utilized to estimate the total capacity. The total capacity is defined as the volume between the top of the geomembrane on the cell liner system and top of the final cover system. Sector A is currently being filled with waste so the existing capacity in that sector was evaluated between the existing contours in that sector and the top of the final cover system of that sector.

The total remaining landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including waste and daily, intermediate and final cover), which provides capacity through 2014 based on Table 3H-1. The total remaining landfill volume available for waste disposal, protective soil and daily, intermediate and final cover (including the remainder of Sector A) and all subsequent planned sectors (B through K) is 63,469,470 CY. The total remaining volume for waste disposal including intermediate cover using the prescriptive final cover profile is 61,292,030 CY. The total volume remaining for waste disposal including intermediate cover utilizing the alternative final cover profile is 61,589,822 CY. The sector

development plan can be seen in Appendix 3E - Site Layout Plans, Drawing P3-16 - Landfill Completion Plan.

## 3H.4 Site Life Calculations

Using the rate of 2% growth per year, an AUF of 1200 lb/cy for MSW and 1800 lb/cy for C&D, an increase in waste received after 2030, and the remaining capacity above, the remaining estimated life of the Landfill is until 2059 for both prescriptive and alternative final cover profiles. See Table 3H-1 and Table 3H-2 for MSW Prescriptive and Alternative Site Life Calculations and Table 3H-3 for C&D Site Life Calculations. See Table 3H-4 for Sector Volume Calculations.

| Sector K | 738,542 | 16.95 | 6,473,319 | 6,336,552 | 6,354,788 |
| Total A-K | 12,060,576 | 276.87 | 63,469,470 | 61,292,030 | 61,589,822 |
| Total C&D | 2,930,931.26 | 67.28 | 2,072,752 | NA | NA |

[A] – Net Volume less 60-inches (36-inches for prescriptive final cover and 24-inches for protective cover). Sector A volume only less 36-inches for prescriptive final cover.

[B] – Net Volume less 52-inches (24-inches for alternative final cover and 28-inches for protective cover). Sector A volume only less 28-inches for alternative final cover.

[C] – Volumes include intermediate cover.

SAIC®

# Appendix 3H
# SITE LIFE PROJECTIONS

## 3H.1 Solid Waste Generation

The McCombs Landfill accepts waste generated in El Paso County, Texas. The Clint Landfill also accepts waste generated in El Paso County. The estimated rate of disposal was calculated assuming an annual population increase of 2% in growth, and assuming a disposal rate of 497,309 tons per year (in 2014 tonnage) until Clint Landfill closes in 2030. 3,000 tons per year are assumed from 2011 through 2013. After Clint Landfill closes, McCombs Landfill will receive all of the waste that would have previously gone to Clint Landfill, therefore the disposal rate at McCombs will raise from 45% of the county waste allocation to 100%. The 1990 base population for central, northeastern and northwestern areas of El Paso (areas where solid waste is planned to go to the McCombs Landfill) was used for the growth rate estimation. The population for the above mentioned areas in 1990 was 322,842 people.

The disposal rate for C&D waste was calculated assuming a disposal rate of 60,000 tons per year (this is the approximate tonnage of C&D disposed of at Clint Landfill 2284 in FY 2010), also with an annual increase of 2% growth.

## 3H.2 Airspace utilization

An airspace utilization factor (AUF) of 0.60 tons per cubic yard (1200 pounds per cubic yard) of landfill airspace was utilized to calculate the site life projections for the volume available at the McCombs Landfill.

## 3H.3 Landfill Capacity

The total landfill capacity represents a total volume available for disposal of solid waste, daily cover material and intermediate cover material. AutoCAD Civil 3D 2011 computer software was utilized to estimate the total capacity. The total capacity is defined as the volume between the top of the geomembrane on the cell liner system and top of the final cover system. Sector A is currently being filled with waste so the existing capacity in that sector was evaluated between the existing contours in that sector and the top of the final cover system of that sector.

The total remaining landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including waste and daily, intermediate and final cover), which provides capacity through 2014 based on Table 3H-1. The total remaining landfill volume available for waste disposal, protective soil and daily, intermediate and final cover (including the remainder of Sector A) and all subsequent planned sectors (B through K) is ~~62,853,182~~ ***63,469,470*** CY. The total remaining volume for waste disposal including intermediate cover using the prescriptive final cover profile is ~~60,675,743~~ ***61,292,030*** CY. The total volume remaining for waste disposal including intermediate cover utilizing the alternative final cover profile is

~~60,973,535~~ ***61,589,822*** CY. The sector development plan can be seen in Appendix 3E - Site Layout Plans, Drawing P3-16 - Landfill Completion Plan.

## 3H.4 Site Life Calculations

Using the rate of 2% growth per year, an AUF of 1200 lb/cy for MSW and 1800 lb/cy for C&D, an increase in waste received after 2030, and the remaining capacity above, the remaining estimated life of the Landfill is until 2059 for both prescriptive and alternative final cover profiles. See Table 3H-1 and Table 3H-2 for MSW Prescriptive and Alternative Site Life Calculations and Table 3H-3 for C&D Site Life Calculations. See Table 3H-4 for Sector Volume Calculations.

| Total C&D | 2,930,931.26 | 67.28 | 2,072,752 | | NA | | NA | |

[A] – Net Volume less 60-inches (36-inches for prescriptive final cover and 24-inches for protective cover). Sector A volume only less 36-inches for prescriptive final cover.

[B] – Net Volume less 52-inches (24-inches for alternative final cover and 28-inches for protective cover). Sector A volume only less 28-inches for alternative final cover.

[C] – Volumes include intermediate cover.

# Appendix 3H
# SITE LIFE PROJECTIONS

## 3H.1 Solid Waste Generation

The McCombs Landfill accepts waste generated in El Paso County, Texas. The Clint Landfill also accepts waste generated in El Paso County. The estimated rate of disposal was calculated assuming an annual population increase of 2% in growth, and assuming a disposal rate of 497,309 tons per year (in 2014 tonnage) until Clint Landfill closes in 2030. 3,000 tons per year are assumed from 2011 through 2013. After Clint Landfill closes, McCombs Landfill will receive all of the waste that would have previously gone to Clint Landfill, therefore the disposal rate at McCombs will raise from 45% of the county waste allocation to 100%. The 1990 base population for central, northeastern and northwestern areas of El Paso (areas where solid waste is planned to go to the McCombs Landfill) was used for the growth rate estimation. The population for the above mentioned areas in 1990 was 322,842 people.

The disposal rate for C&D waste was calculated assuming a disposal rate of 60,000 tons per year (this is the approximate tonnage of C&D disposed of at Clint Landfill 2284 in FY 2010), also with an annual increase of 2% growth.

## 3H.2 Air Apace utilization

An airspace utilization factor (AUF) of 0.60 tons per cubic yard (1200 pounds per cubic yard) of landfill airspace was utilized to calculate the site life projections for the volume available at the McCombs Landfill.

## 3H.3 Landfill Capacity

The total landfill capacity represents a total volume available for disposal of solid waste, daily cover material and intermediate cover material. AutoCAD Civil 3D 2011 computer software was utilized to estimate the total capacity. The total capacity is defined as the volume between the top of the geomembrane on the cell liner system and top of the final cover system. Sector A is currently being filled with waste so the existing capacity in that sector was evaluated between the existing contours in that sector and the top of the final cover system of that sector.

The total remaining landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including ~~both~~ waste and daily, intermediate and final cover), which provides capacity through 2014 based on Table 3H-1. The total remaining landfill volume available for waste disposal, protective soil and daily, intermediate and final cover (including the remainder of Sector A) and all subsequent planned sectors (B through K) is ~~62,532,764~~***62,853,182*** CY. The total remaining volume for waste disposal including intermediate cover using the prescriptive final cover profile is ~~60,355,32~~***60,675,743*** CY. The total volume remaining for waste disposal including intermediate cover utilizing the alternative final cover profile is

~~60,653,116~~***60,973,535*** CY. The sector development plan can be seen in Appendix 3E - Site Layout Plans, Drawing P3-16 - Landfill Completion Plan.

## 3H.4 Site Life Calculations

Using the rate of 2% growth per year, an AUF of 1200 lb/cy for MSW and 1800 lb/cy for C&D, an increase in waste received after 2030, and the remaining capacity above, the remaining estimated life of the Landfill is until 2059 for both prescriptive and alternative final cover profiles. See Table 3H-1 and Table 3H-2 for MSW Prescriptive and Alternative Site Life Calculations and Table 3H-3 for C&D Site Life Calculations. See Table 3H-4 for Sector Volume Calculations.

Table 3H-1
Site Life Calculations for MSW (Prescriptive)

| | | |
|---|---|---|
| Growth Rate | 2% | |

[A] – Net Volume less 60-inches (36-inches for prescriptive final cover and 24-inches for protective cover). Sector A volume only less 36-inches for prescriptive final cover.

[B] – Net Volume less 52-inches (24-inches for alternative final cover and 28-inches for protective cover). Sector A volume only less 28-inches for alternative final cover.

[C] – *Volumes include intermediate cover.*

# Appendix 3H
# SITE LIFE PROJECTIONS

## 3H.1 Solid Waste Generation

The McCombs Landfill accepts waste generated in El Paso County, Texas. The Clint Landfill also accepts waste generated in El Paso County. The estimated rate of disposal was calculated assuming an annual population increase of 2% in growth, and assuming a disposal rate of 497,309 tons per year (in 2014 tonnage) until Clint Landfill closes in 2030. 3,000 tons per year are assumed from 2011 through 2013. After Clint Landfill closes, McCombs Landfill will receive all of the waste that would have previously gone to Clint Landfill, therefore the disposal rate at McCombs will raise from 45% of the county waste allocation to 100%. The 1990 base population for central, northeastern and northwestern areas of El Paso (areas where solid waste is planned to go to the McCombs Landfill) was used for the growth rate estimation. The population for the above mentioned areas in 1990 was 322,842 people.

The disposal rate for C&D waste was calculated assuming a disposal rate of 60,000 tons per year (this is the approximate tonnage of C&D disposed of at Clint Landfill 2284 in FY 2010), also with an annual increase of 2% growth.

## 3H.2 Air Apace utilization

An airspace utilization factor (AUF) of 0.60 tons per cubic yard (1200 pounds per cubic yard) of landfill airspace was utilized to calculate the site life projections for the volume available at the McCombs Landfill.

## 3H.3 Landfill Capacity

The total landfill capacity represents a total volume available for disposal of solid waste, daily cover material and intermediate cover material. AutoCAD Civil 3D 2011 computer software was utilized to estimate the total capacity. The total capacity is defined as the volume between the top of the ***geomembrane*** ~~protective soil layer~~ on the cell liner system and ***top*** ~~bottom~~ of the final cover system. Sector A is currently being filled with waste so the existing capacity in that sector was evaluated between the existing contours in that sector and the ***top*** ~~bottom~~ of the final cover system of that sector.

The total remaining landfill volume available for waste disposal in Sector A is approximately 640,890 cubic yards (including ~~both~~ waste and daily***, intermediate and final*** cover), which provides capacity through 2014 based on Table 3H-1. The total remaining landfill volume available for waste disposal***, protective soil and daily, intermediate and final cover (***including the remainder of Sector A***)*** and all subsequent planned sectors (B through K) is 62,532,764 CY. ***The total remaining volume for waste disposal using the prescriptive final cover profile is 60,355,324 CY. The total volume remaining for waste disposal utilizing the alternative final cover profile is***

***60,653,116 CY.*** The sector development plan can be seen in Appendix 3E - Site Layout Plans, Drawing P3-16 - Landfill Completion Plan.

## 3H.4 Site Life Calculations

Using the rate of 2% growth per year, an AUF of 1200 lb/cy ***for MSW and 1800 lb/cy for C&D***, an increase in waste received after 2030, and the remaining capacity above, the remaining estimated life of the Landfill is ***until 2059 for both prescriptive and alternative final cover profiles*** ~~49 years~~. See Table 3H-1 and Table 3H-2 for MSW ***Prescriptive and Alternative*** ~~and C&D~~ Site Life Calculations ***and Table 3H-3 for C&D Site Life Calculations***. See Table 3H-~~3~~***4*** for Sector Volume Calculations.

# 3I.1 Introduction

This Leachate and Contaminated Water Plan has been developed in accordance with 30 TAC §330.65(c), §330.177, §330.207, §330.331(a)(2), and §330.333 for the McCombs Landfill (Landfill) located in El Paso, TX. This plan provides details of the collection, storage, and disposal of contaminated water, leachate, and gas condensate from the leachate collection system, gas monitoring and collection systems, and site operations.

## 3I.1.1 Definitions

Definitions for the following have been defined by TAC §330.3.

- (36) Contaminated Water – "Leachate, gas condensate, or water that has come into contact with waste."
- (57) Gas Condensate – "The liquid generated as a result of any gas recovery process at a municipal solid waste facility."
- (78) Leachate – "A liquid that has passed through or emerged from solid waste and contains soluble, suspended, or miscible materials removed from such waste."

# 3I.2 Leachate Management

The Leachate Management Plan developed by Raba-Kistner Consultants, Inc., dated April 24, 2002 (Revision 1 – July 29, 2002) was used to assist in the development of the following section and is provided in partial form as Appendix 3I, Attachment 3. Sections, Figures and Appendices not provided have been updated within.

## 3I.2.1 Leachate Generation

Leachate generation was estimated by running the Hydrologic Evaluation of Landfill Performance (HELP) Model, Version 3.07. The HELP model is a program that computes the water balance for municipal landfills based on weather, soil, and design data and uses solution techniques that account for the effects of surface storage, runoff, infiltration, evapotranspiration, vegetation, soil moisture storage, subsurface drainage, recirculation, and leakage.

The climate data for the simulations was synthetically generated using coefficients for El Paso, Texas. The various conditions modeled were as follows:

Table 3I-1
HELP Modeling Methodology/Assumptions

| Scenario | Open Condition (Daily Cover) | Intermediate Cover Condition | Final Cover Condition (Crown) | Final Cover Condition (Side-Slopes) | Final Cover Condition (Crown) – Alt. Cap | Final Cover Condition (Side-Slopes) – Alt. Cap |
|---|---|---|---|---|---|---|

| Simulation Period | 4-Years | 20-Years | 30-Years | 30-Years | 30-Years | 30-Years |

1. Barrier soil (clay) utilized in original prescriptive liner and replaced by caliche in the 2002 Major Permit Amendment. A HELP model demonstration of the effectiveness of the GCL as compared to the barrier soil has been included in this analysis. Modeling for both caliche and GCL alternative liners is provided in Appendix 3J.

Each scenario was evaluated over a simulation period ranging from 4 years to 30 years, as noted in Table 3I-1. Scenarios were modeled to determine the peak daily value for hydraulic head over the liner, liner/cover system efficiency, and leachate generation. Detailed HELP model outputs for each scenario are included in Attachment 1 in Appendix 3I and Peak Daily Hydraulic Head Over Liner values are listed in Table 3I-2.

Table 3I-2
Peak Daily Hydraulic Head Over Base Liner

| Scenario[1] | Average Head (inches) | Maximum Head (inches) |
|---|---|---|
| Open Condition –Scenario 1 Liner System[1] | 2.216 | 3.677 |
| Open Condition –Scenario 2 Liner System[1] | 3.517 | 5.504 |
| Intermediate Cover Condition | 0.406 | 0.765 |
| Final Cover Condition (Crown) | 0.011 | 0.021 |
| Final Cover Condition (Side Slopes) | 0.003 | 0.008 |
| Final Cover Condition (Crown) – Alternative Cap | 0.032 | 0.032 |
| Final Cover Condition (Side Slopes) – Alternative Cap | 0.032 | 0.064 |

[1] – Scenario profiles are detailed in Section 3.4.
[2] – All scenarios shown with 100 percent recirculation of leachate collected from the liner.

## 3I.2.2 Leachate Collection

### Leachate Collection System Design

The leachate collection system was designed in accordance with 30 TAC §330.331(a)(2) and §330.333. The leachate collection system and piping must be:

- Designed to maintain less than 30-centimeters (12-inches) of leachate depth over the liner;
- Made of materials that are chemically resistant. The leachate collection system materials shall be constructed of high density poly-ethylene (HDPE);
- Of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, cover materials, and any equipment; and
- Designed and operated to function through the scheduled closure and post-closure care period.

The system design shall consist of the following components:

- Estimated rate of leachate removal from the sump;
- Capacity of the sump;
- Pipe material and strength;
- Pipe network spacing and grading;
- Collection sump materials and strength;

- Drainage media specifications and performance; and,
- Demonstrate that pipes and perforations will be resistant to clogging and can be cleaned.

These design requirements are discussed in further detail in the sections below. Leachate collection system details are provided on Drawing P3-31 in Appendix 3G.

### Leachate Collection Layer

*30 TAC §330.333(3)(D) and (F)*

The leachate collection layer consist of a 24-inch sand protective layer (drainage material) overlying the geomembrane liner. The drainage material will have a minimum coefficient of permeability of $1.0 \times 10^{-3}$ cm/sec. The effectiveness of this drainage layer is demonstrated in the HELP model analyses completed in Attachment 1 in Appendix 3I. The leachate collection layer will slope at a minimum of one-percent to the leachate collection trench and pipe (maximum of 600-feet).

Existing Sector K sand was also constructed to have a minimum coefficient of permeability of $1.0 \times 10^{-3}$cm/sec.

### Leachate Aggregate

As outlined in the drawings, the leachate aggregate shall consist of 12-inches of 1 ½-inch washed aggregate and 12-inches of pea-gravel. The aggregate gradation change is implemented to substitute using a geotextile to encase the aggregate, which can be a clogging potential long-term.

The 1 ½-inch washed aggregate backfill shall meet the following specifications:

- Clean, washed, non-carbonate, sub-angular to rounded material, bank run gravel with no organic matter. Crushed aggregate, concrete, bituminous, or limestone not allowed. Soil Classification of GW or GP;
- Meeting the following Gradation (ASTM D422):
  1. 100% passing 1 ½-inch sieve
  2. 0% passing ¾-inch sieve

The pea-gravel backfill shall meet the following specifications:

- Durable washed, non-carbonate, coarse-rounded to sub-angular gravel exhibiting the following relationship to the drainage sand layer:
  1. D15 (Pea-gravel)/D85 (Drainage Sand) < 4 to 5
  2. D15 (Pea-gravel)/D15 (Drainage Sand) < 20
     - Where $D_{15}$ and $D_{85}$ are the diameters which 15% and 85% by weight (respectively) are finer.

## Leachate Collection Trenches and Piping

*30 TAC §330.333(2) and §330.333(3)(C), (E) and (G)*

The leachate collection trenches will slope at a minimum of one-percent to the leachate collection sumps. The leachate collection piping will be placed at the center of the leachate collection trench and will be required to meet the following specifications:

- HDPE pipe designated as PE 3408;
- SDR 9 for perforated leachate collection pipe in trenches (8-inch), cleanout riser pipes (8-inch), and for side-slope riser (SSR) pipes (18-inch);
- Maximum deflection of five percent;
- Pipe perforations for leachate collection piping: ½-inch in diameter, 90-degrees apart symmetrical around the pipe, 5-inch linear spacing (Drawing P3-31 in Appendix 3G); and
- Pipe perforations for sump collection piping: ½-inch in diameter, 45-degrees apart symmetrical around the pipe, 3-inch linear spacing (Drawing P3-32 in Appendix 3G).

Calculations for wall crushing, wall buckling, and ring deflection based on the above design parameters are provided in Attachment 2 in Appendix 3I. Calculations show that the leachate collection systems are of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and by any equipment used at the landfill.

Pipe strength calculations were performed separately for the existing lined Phase I/II area (Sector K) to check the pipe strength of the existing pipe in place (6" SDR 11 HDPE pipe). The Sector K pipe calculations are also provided in Appendix 3I, Attachment 2. Calculations show that the existing pipe meets or exceeds the wall crushing, wall buckling and ring deflection requirements for all but the Watkins-Gaube ring deflection. The Watkins-Gaube ring deflection was calculated at 5.15% deflection, which is slightly over the recommended maximum deflection (5%) but under the allowable deflection (7.5%). The pipe is considered to be of sufficient strength and thickness to prevent collapse under the pressures exerted by the additional overlying wastes and waste cover materials for Sector K. Equipment calculations were not provided for Sector K as the critical time for equipment operations over pipe is during the initial lifts of waste being placed in the cell and Sector K already has approximately 50-feet of waste in place to help prevent collapse from equipment.

All leachate piping will have an attached pipe that leads to a reachable point so that the pipe is able to be accessed for cleaning (detail provided on Drawing P3-31 in Appendix 3G).

### Geotextile Cushion

Cushion geotextile will be placed between the geomembrane and the leachate collection backfill (and piping) for puncture protection. The geotextile cushion layer shall be a non-woven polypropylene or polyester fabric required to meet the following specifications:

- Fabric Weight: 16 oz per square yard minimum;
- Puncture Resistance: 240 lbs (ASTM D-4833);

Geotextiles will be required to have a sewn seam or an 18-inch minimum sheet overlap.

### Leachate Sump and Pump

*30 TAC §330.333(3)(A) and (B)*

The leachate sump will consist of a 3-foot deep rectangular area. The sump will have a minimum nominal dimension of 8-foot by 8-foot at the base and 26-foot by 26-foot at the top; for a minimum volume of 948 cubic feet (CF). The capacity of the sump has been selected to limit the maximum head on the liner. The media within the sump is to meet the same specifications as that of the 1½-inch aggregate specified for leachate collection aggregate. The average porosity for this aggregate is assumed to be 30%. Based on the porosity, 284 CF (2,124 gallons) in the sump will be available for leachate storage.

Based on the HELP model, the average yearly leachate generation rate for the open condition (maximum leachate generation) is 418 CF/acre/year (or 0.2 gallons per minute (gpm) based on the largest designed sector of 39-acres). Therefore, the recommended pumping size is from 5 gpm to 10 gpm to allow for periodic increases in precipitation.

The pumps will be operated by level transducers to ensure that leachate head does not exceed 12-inches over the liner (or approximately 48-inches in the sump, dependent on actual construction). Transducers will cycle on at approximately 36-inches of head within the sump (or 0-inches of head on the liner) and cycle off at approximately 6-inches of head within the sump. The pump hour reading will be recorded on a quarterly basis and kept in the Site Operating Record.

The leachate sump for Sector K was designed to have a nominal dimension of 7-foot by 7-foot at the base and 21-foot by 21-foot at the top; for a minimum volume of 735 cubic feet (CF). The average porosity for the aggregate is assumed to be 30%. Based on the porosity, 221 CF (1,653 gallons) in the sump are available for leachate storage. Based on the HELP model, the average yearly leachate generation rate for the open condition is 418 CF/acre/year (or 0.1 gpm based on Sector K size of 16.95 acres).

## 3I.2.3 Leachate Storage

Leachate will be stored within the leachate sump and within the waste mass on site.

### 3I.2.4 Leachate Disposal

Leachate will be disposed of within the waste mass on site.

### 3I.2.5 Leachate Recirculation

Leachate removed from the sumps will be recirculated within the waste mass. As shown in the HELP model results in Attachment 1 in Appendix 3I, 100% of the leachate can be recirculated back into the waste mass, while still maintaining less than 12-inches of leachate head on the liner.

The volume of leachate removed and recirculated, based on the sump pump hour meter reading, will be recorded quarterly in the Site Operating Record. Periodic analysis of leachate quality will also be placed in the Site Operating Record.

## 3I.3 Contaminated Water Management

The Contaminated Water Management Plan developed by Raba-Kistner Consultants, Inc., dated April 24, 2002 (Revision 1 – July 29, 2002) is included in partial form for compliance with 30 TAC §330.305 (b) and (c) Attachment 3 in Appendix 3I. No changes are recommended from this design.

Stormwater that comes into contact with the active working face and is not contained within the site run-on/runoff berms will be managed in the following manner:

- Contaminated water will be contained as best possible within site sedimentation basins or other low-lying areas onsite;
- Testing will be completed on the contaminated water in accordance with the site SWPPP; and
- If testing indicates that the water is contaminated, it will be pumped out of the containment area into a tanker truck and transferred to the El Paso Waste Water Treatment Plant.

Any water that infiltrates or evaporates prior to being transferred offsite shall be considered mitigated or controlled and no further action will be taken.

## 3I.4 Gas Condensate Management

If gas condensate is produced, it will be stored and disposed of as leachate.

**********

NOTE: INITIAL MOISTURE CONTENT OF THE LAYERS AND SNOW WATER
WERE SPECIFIED BY THE USER.

LAYER 1
---

TYPE 1 - VERTICAL PERCOLATION LAYER
MATERIAL TEXTURE NUMBER 8

| | | | |
|---|---|---|---|
| THICKNESS | = | 6.00 | INCHES |
| POROSITY | = | 0.4630 | VOL/VOL |
| FIELD CAPACITY | = | 0.2320 | VOL/VOL |
| WILTING POINT | = | 0.1160 | VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.2638 | VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.369999994000E-03 | CM/SEC |

LAYER 2
---

TYPE 2 - LATERAL DRAINAGE LAYER

MATERIAL TEXTURE NUMBER 2

| | | | |
|---|---|---|---|
| THICKNESS | = | 12.00 | INCHES |
| POROSITY | = | 0.4370 | VOL/VOL |
| FIELD CAPACITY | = | 0.0620 | VOL/VOL |
| WILTING POINT | = | 0.0240 | VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0400 | VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.579999993000E-02 | CM/SEC |
| SLOPE | = | 33.00 | PERCENT |
| DRAINAGE LENGTH | = | 475.0 | FEET |

## LAYER 3

TYPE 4 - FLEXIBLE MEMBRANE LINER

MATERIAL TEXTURE NUMBER 36

| | | | |
|---|---|---|---|
| THICKNESS | = | 0.04 | INCHES |
| POROSITY | = | 0.0000 | VOL/VOL |
| FIELD CAPACITY | = | 0.0000 | VOL/VOL |
| WILTING POINT | = | 0.0000 | VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0000 | VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.399999993000E-12 | CM/SEC |
| FML PINHOLE DENSITY | = | 1.00 | HOLES/ACRE |
| FML INSTALLATION DEFECTS | = | 2.00 | HOLES/ACRE |
| FML PLACEMENT QUALITY | = | 3 - GOOD | |

## LAYER 4

TYPE 3 - BARRIER SOIL LINER

MATERIAL TEXTURE NUMBER 0

| | | | |
|---|---|---|---|
| THICKNESS | = | 18.00 | INCHES |
| POROSITY | = | 0.4570 | VOL/VOL |
| FIELD CAPACITY | = | 0.1310 | VOL/VOL |
| WILTING POINT | = | 0.0580 | VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.4570 | VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.999999975000E-05 | CM/SEC |

## LAYER 5

TYPE 1 - VERTICAL PERCOLATION LAYER

MATERIAL TEXTURE NUMBER 6

| | | | |
|---|---|---|---|
| THICKNESS | = | 12.00 | INCHES |
| POROSITY | = | 0.4530 | VOL/VOL |
| FIELD CAPACITY | = | 0.1900 | VOL/VOL |
| WILTING POINT | = | 0.0850 | VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.1900 | VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.720000011000E-03 | CM/SEC |

## LAYER 6

TYPE 1 - VERTICAL PERCOLATION LAYER
MATERIAL TEXTURE NUMBER 18

| | | |
|---|---|---|
| THICKNESS | = | 2400.00 INCHES |
| POROSITY | = | 0.6710 VOL/VOL |
| FIELD CAPACITY | = | 0.2920 VOL/VOL |
| WILTING POINT | = | 0.0770 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.2500 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.100000005000E-02 CM/SEC |

NOTE: 100.00 PERCENT OF THE DRAINAGE COLLECTED FROM LAYER # 9 IS RECIRCULATED INTO THIS LAYER.

LAYER 7

TYPE 1 - VERTICAL PERCOLATION LAYER
MATERIAL TEXTURE NUMBER 18

| | | |
|---|---|---|
| THICKNESS | = | 168.00 INCHES |
| POROSITY | = | 0.6710 VOL/VOL |
| FIELD CAPACITY | = | 0.2920 VOL/VOL |
| WILTING POINT | = | 0.0770 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.2920 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.100000005000E-02 CM/SEC |

LAYER 8

TYPE 1 - VERTICAL PERCOLATION LAYER
MATERIAL TEXTURE NUMBER 0

| | | |
|---|---|---|
| THICKNESS | = | 12.00 INCHES |
| POROSITY | = | 0.4370 VOL/VOL |
| FIELD CAPACITY | = | 0.0620 VOL/VOL |
| WILTING POINT | = | 0.0240 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0621 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.100000005000E-02 CM/SEC |

LAYER 9

TYPE 2 - LATERAL DRAINAGE LAYER
MATERIAL TEXTURE NUMBER 0

| | | |
|---|---|---|
| THICKNESS | = | 12.00 INCHES |
| POROSITY | = | 0.4370 VOL/VOL |
| FIELD CAPACITY | = | 0.0620 VOL/VOL |
| WILTING POINT | = | 0.0240 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0620 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.100000005000E-02 CM/SEC |
| SLOPE | = | 1.00 PERCENT |
| DRAINAGE LENGTH | = | 350.0 FEET |

NOTE: 100.00 PERCENT OF THE DRAINAGE COLLECTED FROM THIS LAYER IS RECIRCULATED INTO LAYER # 6.

LAYER 10
--------

TYPE 4 - FLEXIBLE MEMBRANE LINER
MATERIAL TEXTURE NUMBER 35

| | | |
|---|---|---|
| THICKNESS | = | 0.06 INCHES |
| POROSITY | = | 0.0000 VOL/VOL |
| FIELD CAPACITY | = | 0.0000 VOL/VOL |
| WILTING POINT | = | 0.0000 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0000 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.199999996000E-12 CM/SEC |
| FML PINHOLE DENSITY | = | 1.00 HOLES/ACRE |
| FML INSTALLATION DEFECTS | = | 2.00 HOLES/ACRE |
| FML PLACEMENT QUALITY | = | 3 - GOOD |

LAYER 11
--------

TYPE 3 - BARRIER SOIL LINER
MATERIAL TEXTURE NUMBER 0

| | | |
|---|---|---|
| THICKNESS | = | 0.24 INCHES |
| POROSITY | = | 0.7500 VOL/VOL |
| FIELD CAPACITY | = | 0.7470 VOL/VOL |
| WILTING POINT | = | 0.4000 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.7500 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.499999997000E-08 CM/SEC |

LAYER 12
--------

TYPE 1 - VERTICAL PERCOLATION LAYER
MATERIAL TEXTURE NUMBER 2

| | | |
|---|---|---|
| THICKNESS | = | 6.00 INCHES |
| POROSITY | = | 0.4370 VOL/VOL |
| FIELD CAPACITY | = | 0.0620 VOL/VOL |
| WILTING POINT | = | 0.0240 VOL/VOL |
| INITIAL SOIL WATER CONTENT | = | 0.0610 VOL/VOL |
| EFFECTIVE SAT. HYD. COND. | = | 0.579999993000E-02 CM/SEC |

GENERAL DESIGN AND EVAPORATIVE ZONE DATA
---

NOTE: SCS RUNOFF CURVE NUMBER WAS COMPUTED FROM DEFAULT SOIL DATA BASE USING SOIL TEXTURE # 8 WITH A POOR STAND OF GRASS, A SURFACE SLOPE OF 33.% AND A SLOPE LENGTH OF 759. FEET.

| | | | |
|---|---|---|---|
| SCS RUNOFF CURVE NUMBER | = | 86.10 | |
| FRACTION OF AREA ALLOWING RUNOFF | = | 100.0 | PERCENT |
| AREA PROJECTED ON HORIZONTAL PLANE | = | 1.000 | ACRES |
| EVAPORATIVE ZONE DEPTH | = | 18.0 | INCHES |
| INITIAL WATER IN EVAPORATIVE ZONE | = | 2.063 | INCHES |

| | | | |
|---|---|---|---|
| UPPER LIMIT OF EVAPORATIVE STORAGE | = | 8.022 | INCHES |
| LOWER LIMIT OF EVAPORATIVE STORAGE | = | 0.984 | INCHES |
| INITIAL SNOW WATER | = | 0.000 | INCHES |
| INITIAL WATER IN LAYER MATERIALS | = | 663.660 | INCHES |
| TOTAL INITIAL WATER | = | 663.660 | INCHES |
| TOTAL SUBSURFACE INFLOW | = | 0.00 | INCHES/YEAR |

## EVAPOTRANSPIRATION AND WEATHER DATA

NOTE: EVAPOTRANSPIRATION DATA WAS OBTAINED FROM
EL PASO TEXAS

| | | | |
|---|---|---|---|
| STATION LATITUDE | = | 31.80 | DEGREES |
| MAXIMUM LEAF AREA INDEX | = | 0.00 | |
| START OF GROWING SEASON (JULIAN DATE) | = | 66 | |
| END OF GROWING SEASON (JULIAN DATE) | = | 315 | |
| EVAPORATIVE ZONE DEPTH | = | 18.0 | INCHES |
| AVERAGE ANNUAL WIND SPEED | = | 9.20 | MPH |
| AVERAGE 1ST QUARTER RELATIVE HUMIDITY | = | 40.00 | % |
| AVERAGE 2ND QUARTER RELATIVE HUMIDITY | = | 27.00 | % |
| AVERAGE 3RD QUARTER RELATIVE HUMIDITY | = | 46.00 | % |
| AVERAGE 4TH QUARTER RELATIVE HUMIDITY | = | 48.00 | % |

NOTE: PRECIPITATION DATA WAS SYNTHETICALLY GENERATED USING
COEFFICIENTS FOR EL PASO TEXAS

NORMAL MEAN MONTHLY PRECIPITATION (INCHES)

| JAN/JUL | FEB/AUG | MAR/SEP | APR/OCT | MAY/NOV | JUN/DEC |
|---|---|---|---|---|---|
| 0.38 | 0.45 | 0.32 | 0.19 | 0.24 | 0.56 |
| 1.60 | 1.21 | 1.42 | 0.73 | 0.33 | 0.39 |

NOTE: TEMPERATURE DATA WAS SYNTHETICALLY GENERATED USING
COEFFICIENTS FOR EL PASO TEXAS

NORMAL MEAN MONTHLY TEMPERATURE (DEGREES FAHRENHEIT)

| JAN/JUL | FEB/AUG | MAR/SEP | APR/OCT | MAY/NOV | JUN/DEC |
|---|---|---|---|---|---|
| 44.20 | 48.40 | 55.10 | 63.60 | 71.90 | 80.80 |
| 82.50 | 80.30 | 74.10 | 63.60 | 51.40 | 44.40 |

NOTE: SOLAR RADIATION DATA WAS SYNTHETICALLY GENERATED USING
COEFFICIENTS FOR EL PASO TEXAS
AND STATION LATITUDE = 31.80 DEGREES

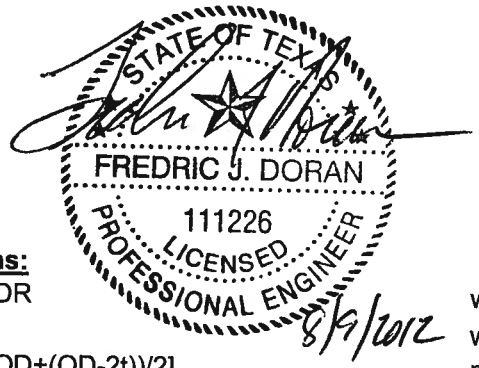
# Appendix 3I - Attachment 2
# Pipe Deflection Calculations

SAIC®

**Pipe Deflection Calculations**
**McCombs Landfill - 4/15/11 (SSK)**



6 inch pipe

**Equations:**

t = OD/SDR — wall thickness
$I = t^3/12$ — wall moment of inertia
R = 0.5[(OD+(OD-2t))/2] — mean radius
W = OD*[(6*120)+(120*66.7)]/144 — vertical stress
Wp = (W*12)/(12-($D_p$*N)) — modified vertical stress
$x = (D*K*W*R^3) / [(E*I) + (0.061*E'*R^3)]$ — deflection
Deflection % = x/(2*R)

Input Variables

| | | |
|---|---|---|
| **OD (in.) =** | 6.625 | |
| K = | 0.1 | pipe bedding constant (0.1) |
| D = | 1.0 | deflection lag factor (1.0) |
| E (psi) = | 133,000 | Pipe Mod of Elasticity |
| E' (psi) = | 3,000 | Soil Mod of Reaction |
| Soil Cover Depth (ft.) = | 8 | |
| Waste Depth (ft.) = | 264 | |
| Soil Cover Dens. (pcf) = | 120 | |
| Waste Dens. (pcf) = | 66.7 | |
| $D_p$ = | 0.5 | diameter of perforation (inches) |
| N = | 2.4 | number of perforations per foot |

Design Criteria

| | |
|---|---|
| Recommended Maximum Deflection | 5.0% |
| Allowable Maximum Deflection | 7.5% |

## Memorandum

To: TCEQ

From: Cami Van Abel, P.E.

Subject: Raba Kistner Leachate and Contaminated Water Plan

Date: March 15, 2013

The Leachate and Contaminated Water Plan prepared by Raba Kistner Consultants, Inc. and dated April 24, 2002 (Revision 1 – July 29, 2002) is provided in partial form to provide details for contaminated water management for the updated leachate and contaminated water plan. The calculations prepared by Raba Kistner are still relevant to current conditions at the site and they comply with 30 TAC §330.305 (b) and (c). Sections 2 through 10, Figures Att15-2 through Att15-4, and Appendices Atta15-B through Att15-G have been removed from the Raba Kistner plan as they have been updated throughout Permit No. 729B.

# LEACHATE AND CONTAMINATED WATER PLAN

## 1.0 CONTAMINATED WATER

Drainage and run-off from the active area that comes in direct contact with waste will be retained by temporary toe berms. These berms will be sized to hold the volume of water produced by the 24-hour, 25 year storm event assuming an active face of 250 ft x 250 ft (see Figure Att15-1). The assumed area of the active face is based on our experience for landfills with comparative waste disposal rates to the McCombs Landfill. The 24-hour, 25-year storm event maps from the Weather Bureau (NWS) Technical Paper 40, Rainfall Frequency Atlas of the United States can be found in Appendix Att15-A. Plate 1 of Appendix Att15-A displays a storm event map for the Central and Eastern United States, which includes the state of Texas. Plate 2 of Appendix Att15-A displays a storm event map with greater isopluvial detail for the area near the site. The two maps were compared with each other to obtain the 24-hour, 25-year storm event used in calculating the temporary toe berm and run-on berm sizes.

Calculations for sizing the temporary toe berms are as follows:

FOR PERMITTING ONLY,
NOT FOR CONSTRUCTION
Valerie Joosten 8/7/02

STATE OF TEXAS
VALERIE A. JOOSTEN
89118
LICENSED
PROFESSIONAL ENGINEER

Assumptions:

1. An active working face of 250 ft x 250 ft
2. Dikes/berms placed 50 ft down flow from active area
3. 24-hour, 25-year storm event = 3.0 inches = 0.25 ft
4. Active face 3:1 slope
5. Effective berm height = 2.0 ft (3.0 feet high minus 1.0 ft of freeboard)

Sample Calculation:

Maximum surface = 250 ft x (250 ft + 50 ft) = 75,000 ft²
Total rainfall volume = 75,000 ft² x .25 ft = 18,750 ft³
Volume retained by berm = 2 ft x (50 ft x 250 ft) + $\frac{2 \text{ ft} (3 \times 2 \text{ ft})}{2}$ x 250 ft = 26,500 ft³

26,500 ft³ retention volume/18,750 ft³ rainfall volume = 1.41 safety factor

Stormwater from areas with six (6) inches of daily cover and any area with alternate daily cover is considered contaminated. Inactive areas with six (6) inches of daily cover will be inspected weekly for erosion, ponded water, seeps, protruding waste or other conditions that may cause contaminated runoff from daily cover. After a period of 180 days, an additional six (6) inches of cover material will be placed over the daily cover for a total of not less than twelve (12) inches of cover. This 12-inch layer of cover material will be classified as "intermediate cover". Stormwater runoff from intermediate cover areas will be considered uncontaminated. Once the area becomes active again, the top six inches of intermediate cover material may be stripped off for use as daily cover in other areas.

Surface water run-on to the working face will be controlled with temporary run-on berms as shown on Figure Att15-1. Calculations for sizing the temporary run-on berms are as follows:

Assumptions:

1. 24-hour, 25 year storm event = 3.0 inches = 0.25 feet.
2. All surface water flow encountering run-on berms will be sheet flow.
3. Run-on berms are temporary with a maximum length of 300 ft centered on working face.
4. Berm height = 2.0 ft (24 in.)

Since flow to be handled by the run-on berm is sheet flow, the depth of water to be diverted will be 0.25 feet.

Sample calculation:

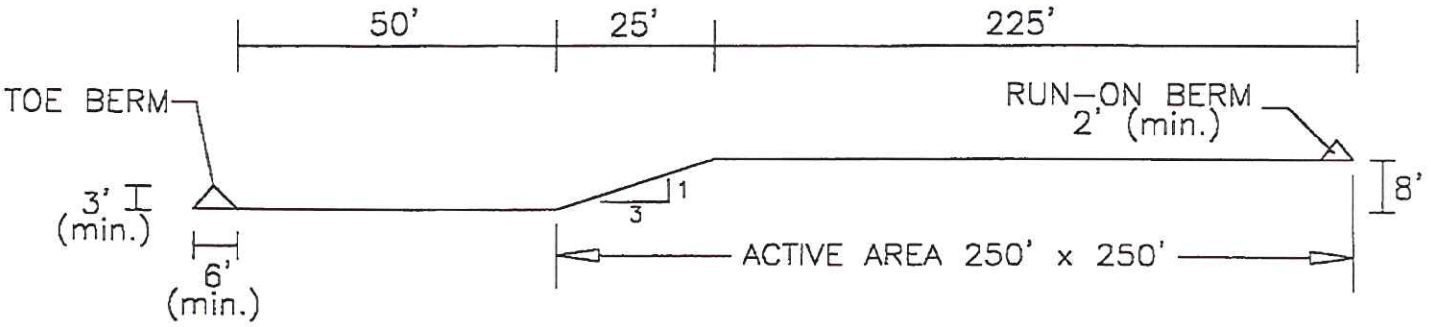
0.25 feet + 1.0 foot of freeboard = 1.25 feet (min.) berm height

2.0 feet (min.) constructed height/1.25 feet (min.) required height = 1.60 safety factor

Valerie Joosten 8/7/02

FOR PERMITTING ONLY,
NOT FOR CONSTRUCTION

# FIGURES



TOE BERM CALCULATIONS

ASSUMPTIONS:

1. An active working face of 250' x 250'
2. Berms placed 50' download flow from active area
3. 24 hour–25 year storm event = 3" = 0.25 feet
4. Active face 3:1 slope
5. Effective berm height = 2' (24")
6. Berm height = 3' (36")(1.0' freeboard)

CALCULATIONS:

Max Surface = 250' x (250'+50') = 75,000 $ft^2$

Total rainfall volume = 75,000 $ft^2$ x .25' = 18,750 $ft^3$

Retention Volume

$$= 2'(50' \times 250') + \frac{2'(3' \times 2')}{2} \times 250' = 26{,}500\ ft^3$$

26,500 $ft^3$ retention volume/18,750 $ft^3$ rainfall volume = 1.41 Safety Factor

RUN–ON BERM CALCULATION

ASSUMPTIONS:

1. 24 hour–25 year storm event = 3" = 0.25 feet
2. All flows to run–on berms will be sheet flow
3. Run–on berms are temporary with a maximum length 300', centered on working face.
4. Berm 2.0' (24")

Since flows to be handled by the run–on berm are sheet flows, the depth of water to be diverted will be 0.25 feet.

CALCULATION:

0.25' + 1.0' freeboard = 1.25' (min) berm height

2' (min.) constructed height/1.25 (min.) required height = 1.60 Safety Factor

# Appendix 3J
# LINER QUALITY CONTROL PLAN
30 TAC §330.63(d)(4)(G), §330.331, §330.335, §330.337, §330.339, §330.341

This Liner Quality Control Plan (LQCP) has been prepared in accordance with 30 TAC §330.339 and details construction quality practices that will be undertaken to assure compliance with the Texas Commission on Environmental Quality (TCEQ) Municipal Solid Waste Rules (MSWR). This LQCP has been prepared using regulatory guidance documents, standard industry practices and testing methods current as of the issuance of this report. Quality assurance and quality control (QA/QC) practices for construction projects should follow the most up to date technical guidelines of the executive director. This LQCP provides QA/QC guidelines for the design, construction, testing parameters and frequency, and documentation of the landfill liner and leachate collection system construction.

## 3J.1 Scope

This LQCP is intended for construction of the sanitary landfill liner for the City of El Paso, Texas, McCombs Landfill (Landfill). The LQCP is intended to address 3 types of liner construction scenarios at the Landfill. The design structure of the liner system scenarios are described below.

Scenario 1 addresses a prescriptive (i.e., current permitted) liner system, consisting of (in ascending order):

- 6-inch scarified and compacted subgrade;
- 6-inch compacted caliche;
- 60-mil high density polyethylene (HDPE) geomembrane liner;
- 24-inch sand protective layer; and,
- Waste.

Scenario 2 describes an alternative liner system to Scenario 1 to be used in instances where caliche is not available for cell construction or is not cost effective to obtain. This scenario design system consists of (in ascending order):

- 6-inch scarified and compacted subgrade;
- Geosynthetic Clay Liner (GCL);
- 60-mil HDPE geomembrane liner;
- 24-inch sand protective layer; and,
- Waste.

Scenario 3 addresses a ”piggy-backed” liner system for portions of the Landfill where liner construction occurs over existing unlined municipal solid waste (MSW) fill areas. This scenario provides for a component of geotechnical stability where the

liner system is being constructed over waste fill areas with the potential for non-uniform settlement. This design system consists of (in ascending order, beginning with the waste material present at the time of "piggy-back" cell construction):

- Inert construction and demolition (C&D) waste;
- 12-inch intermediate cover;
- 36-inch compacted onsite soil;
- 6-inch bedding sand;
- Primary uniaxial geogrid;
- Secondary uniaxial geogrid;
- GCL;
- 60 mil HDPE geomembrane liner;
- 24-inch sand protective layer, and;
- Waste.

As stated previously, Scenario 1 and Scenario 2 liner systems are presented as interchangeable liner design systems and the use of either liner system will be determined based on the availability of caliche. Scenario 3 liner system is specific to the areas of the Landfill where waste material is considered in the foundation of the liner system for the "piggy-back" cell development.

The Landfill cell will be sloped to drain liquid to leachate collection trenches along the centerline of each cell. The leachate collection trenches will include a perforated HDPE pipe backfilled with aggregate. The leachate collection system is described further in Section 3J.5.1 and detailed in Appendix 3I.

## 3J.2 Construction Quality Assurance Personnel

All quality assurance personnel associated with Landfill cell construction will be properly trained and qualified to test and inspect the components of cell construction in their respective areas of expertise.

The Construction Quality Assurance (CQA) Professional of Record (POR) will be responsible for all CQA activities associated with liner system construction. The POR will be licensed as a Professional Engineer in Texas. The POR will be experienced in geotechnical engineering and/or engineering geology with relation to landfill cell construction.

The POR representative will be responsible for the implementation of field inspection and testing activities under the direct supervision of the POR. The POR representative is responsible for the CQA monitoring and must be an engineering technician with a minimum of 4 years relevant experience, or an engineer or geologist with at least 1 year of relevant experience.

Any references to surveying contained within this LQCP shall be required to be performed by a professional land surveyor registered in the State of Texas.

# 3J.3 Site Geology

Site geological information is described in Section 3.5 of the permit report. The liner system is designed with separation distance of over 300 feet from the highest observed groundwater elevation at the Landfill. Therefore, de-watering efforts or uplift analysis and ballast support is not required for landfill cell construction.

# 3J.4 Location

The landfill is located at 13600 McCombs Road, on the northeast side of the City of El Paso, Texas.

# 3J.5 Leachate Collection System Design

The leachate collection system shall be constructed according to construction drawings provided in Appendix 3G and consists of:

- Collection Trenches (ascending order):
  - 8-ounce geotextile filter fabric;
  - 8-inch diameter HDPE leachate collection perforated and non-perforated pipes;
  - 12-inch thick layer of washed aggregate (maximum of 5% of calcium carbonate content);
  - 12-inch thick layer of pea gravel backfill (maximum of 5% of calcium carbonate content); and,
  - 24-inch thick layer of protective sand.
- Leachate collection sump (ascending order):
  - 8-ounce geotextile filter fabric;
  - 18-inch diameter HDPE leachate transfer pipe;
  - 12-inch thick layer of washed aggregate (maximum of 5% of calcium carbonate content);
  - 12-inch thick layer of pea gravel backfill (maximum of 5% of calcium carbonate content); and,
  - 24-inch thick layer of protective sand.

# 3J.6 Site Preparation and Slopes

## 3J.6.1 Grading

The cell footprint should be prepared to the required grade prior to the construction of the liner system. All necessary grading and fill placement including side slopes shall be performed according to construction drawings. Anchor trenches shall be built as detailed in the construction drawings.

### 3J.6.2 Slopes

The slope of excavation faces shall be proportioned according to construction drawings and shall be in accordance with Occupational Safety and Health Administration (OSHA) excavation and trenching regulations.

A slope stability analysis is provided in Appendix 3-G, Attachment 3. The analysis is valid for the conditions and design set forth in the calculations.

Construction slopes shall not be steeper than the final slopes. No construction activities which may present concentrated loadings or stress, such as heavy equipment storage or soil stockpiles shall not be placed within 100 feet of slope crests unless additional slope stability analysis are performed.

### 3J.6.3 Excavation Faces Protective Layer

A 24-inch thick protective sand layer will be placed over the geomembrane as described in Section 3J.8.6. The protective layer will also act as a drainage media, allowing the transport of leachate to the low-lying leachate collection sump area. The intended sand to be used as protective layer will be sampled for material conformance as detailed in Table 3J.1. The POR representative will review the analytical results to ensure compliance with project specifications. The protective sand shall be placed directly on top of the geomembrane using a backhoe or belt conveyor. No construction equipment will be allowed to operate on the geomembrane without at least 12-inches of soil in place over the geomembrane. The remainder of the protective sand layer shall be placed using a low ground pressure dozer (see Table 3J-2).

## 3J.7 Material Field and Laboratory Testing

The POR will be responsible for the implementation of field inspection and testing activities. The Contractor, with oversight by the POR representative, will obtain soil and geosynthetic samples for third-party analysis. Laboratory and field tests are identified in Table 3J.1. The table presents testing requirements for pre-construction borrow source acceptance, placement requirements and post-placement requirements, where applicable. Additional tests may be required or recommended by the POR and/or POR representative prior to material acceptance. Other tests and services normally provided by inspection and testing agencies may also be conducted as the POR and/or POR representative directs.

Table 3J.1
Laboratory and Field QA/QC Testing

| | Material | Test | Test Method | Minimum Test Frequency | Minimum Passing Requirements |
|---|---|---|---|---|---|
| 1. | SUBGRADE (IN-SITU SOIL) | | | Prior to Grading | |
| | | Particle Size Distribution | ASTM D 422 or ASTM D 1140 | 1 test/material type | ≥ 30% passing 200 sieve; 100% passing 1 in. screen |
| | | Standard Proctor Test | ASTM D 698 | 1 test/material type | NA |
| | | Moisture Content | ASTM D 2216 | 1 test/material type | NA |
| | | Soil Classification | ASTM D2487 | 1 test/material type | CL, CL-ML, CH |
| | | | | During Placement | |
| | | Field Density and Water Content (Nuclear Methods) | ASTM D 6938 | 1/8,000 $ft^2$ per 6 in. lift | ≥95% Maximum Dry Density ± 3% optimum moisture |
| | | Direct Shear (Subgrade/GCL) | ASTM D 5321 | 1/Material Type | Min 24 degrees[7] |
| 2. | SOIL LINER (6 IN. COMPACTED CALICHE) | | | Borrow Source | |
| | | Particle Size Distribution | ASTM D 422 or ASTM D 1140 | 1 test/material type | ≥ 30% passing 200 sieve; 100% passing 3/8 in. screen |
| | | Standard Proctor Test | ASTM D 698 | 1 test/material type | NA |
| | | Moisture Content | ASTM D 2216 | 1 test/material type | NA |
| | | Permeability | TAC Designated Methodology[1] | 1 test/material type | ≤ $1x10^{-7}$ cm/sec |
| | | Plasticity Index | ASTM D 4318 | 1 test/material type | ≥ 15 |
| | | Liquid Limit | ASTM D 4318 | 1 test/material type | ≥ 30 |
| | | Soil Classification | ASTM D2487 | 1 test/material type | CL, CL-ML, CH |
| | | | | During Placement | |
| | | Field Density and Water Content (Nuclear Methods) | ASTM D 6938 | 1/8,000 $ft^2$ per 6 in. lift Min 3 tests per 6 in. lift | ≥95% Maximum Dry Density ± 2% optimum moisture |
| | | Particle Size Distribution | ASTM D 422 or ASTM D 1140 | 1/100,000 $ft^2$ per 6 in. lift | ≥ 30% passing 200 sieve; 100% passing 3/8 in. screen |
| | | Plasticity Index | ASTM D 4318 | 1/100,000 $ft^2$ per 6 in. lift | ≥ 15 |
| | | Liquid Limit | ASTM D 4318 | 1/100,000 $ft^2$ per 6 in. lift | ≥ 30 |
| | | Permeability | TAC Designated | 1/100,000 $ft^2$ per 6 in. lift | ≤ $1x10^{-7}$ cm/sec |

Notes:

N/A – Not Applicable
MARV – Minimum Average Roll Value
[1] Permeability testing methodology described in 30 TAC §330.339 (c).
[2] Bentonite property tests performed at processing facility before shipment to GCL production facilities.
[3] Bentonite mass/area reported at 0% moisture content.
[4] All tensile testing shall be performed in the machine direction, with results as minimum average roll values unless otherwise indicated.
[5] Index flux and permeability testing with desired distilled/de-ionized water at 80 lb/in$^2$ (551 kPa) tailwater pressure.
[6] Peak value measured at 200 lb/ft$^2$ (30 kPa) normal stress.
[7] Interface friction angles shall be tested between the Subgrade/GCL, GCL/Geomembrane, and Geomembrane/Protective Sand to comply with calculations in Appendix 3G, Attachment 3.
[8] Four of 5 tests from each sample must have a shear strength no less than 95% of the minimum yield sheet strength, with the minimum acceptable shear strength no less than 120 lb/in, regardless of seaming method.
[9] For seams performed using hot wedge methods, 4 of 5 tests from each sample must have a peel strength no less than 62% of the minimum yield sheet strength, with the minimum acceptable peel strength of no less than 91 lb/in. For seams performed using extrusion fillet methods, 4 of 5 tests from each sample must have a peel strength of no less than 72% of the minimum yield sheet strength, with the minimum acceptable peel strength no less than 78 lb/in.
[10]The ASTM D 3042 test shall use a HCL solution having a pH of no more than 5.
[11]The pea gravel will act as a filter medium between the protective sand layer and the aggregate. Based on the gradation results of the 3 drainage material, the following criteria shall be met between all layers:

1. Criterion 1: $D_{15\ (lower)}/D_{85\ (upper)} < 4$ to 5
2. Criterion 2: $D_{15\ (lower)}/D_{15\ (upper)} < 20$

[12]Material conformance documentation will be provided by the contractor or contractor's selected geomembrane manufacturer to the POR prior to material delivery to the site.

# 3J.8 Material Placement

## 3J.8.1 Subgrade

To prepare the subgrade for cell construction, the area will initially be proof-rolled with heavy, rubber-tired construction equipment to detect "soft" areas or otherwise unsuitable issues for cell liner construction. Soft areas will be excavated and replaced with suitable onsite general fill material and re-compacted. Debris, including roots and stumps will be removed from the construction area. Areas determined to be unsuitable for cell liner construction will be excavated to the extent necessary to attain suitable conditions. The excavated area will be backfilled with material deemed suitable (soil material meeting the characteristics of Materials 1 or 2 listed in Table 3J.1) for cell liner construction. The material will be placed in lifts not exceeding 8-inches in thickness and compacted until the designed subgrade elevations in the area are attained. The backfilled material will be "stair-stepped" laterally into the native material as shown in Detail 3J-2 below. The surface of each of the steps in the surrounding subgrade will be scarified to maximize bonding between the new and old sections.

The upper 6-inches of the subgrade will be scarified and roughened. Water will be added as necessary to provide a suitable firm subgrade so that optimum compaction density of not less than 95% of maximum density as determined by the standard proctor compaction test (ASTM D 698) is attained. The moisture content of the materials shall be uniform and within plus or minus 3% of optimum value as determined by ASTM D 2216. Required laboratory and field QA/QC tests, collection frequency and passing requirements are presented above in Table 3J.1. In place density and moisture testing will be conducted as described below in Section 3J.8.2. Construction will be sequenced in such a manner to maintain drainage and minimize the potential effects of precipitation on the construction area. Excavation activities will occur in strict adherence to OSHA regulations.

The POR representative will observe the subgrade preparation to ensure suitability for cell liner construction. The POR representative will verify the thickness of the subgrade through visual confirmation that the scarified and compacted in-situ soil is a minimum of 6-inches thick. Prior to the placement of the caliche (if used for the cell construction), the top of the finished subgrade will be surveyed for topographic elevations at a minimum rate of one survey point per 5,000 square feet of cell liner limits.

## 3J.8.2 Prescriptive Primary Liner – Caliche

Once the finished, compacted subgrade is confirmed to adhere with material specifications and is surveyed, caliche material shall be placed in one lift not to exceed 8-inches in loose depth and then compacted to the required density of not less than 95% of maximum density as determined by the Standard Proctor Compaction Test (ASTM D 698). In instances where caliche is already present within the proposed construction area, approximately 8-inches of caliche material will be scarified as "loose" material and compacted to attain the 6-inch thickness requirements. If an area

of the cell is determined to be unsuitable for in-situ liner construction, the identified area will be excavated to the extent necessary to attain suitable conditions. The excavated area will be backfilled with material deemed suitable (soil material meeting the characteristics of Material 2 listed in Table 3J.1) for cell liner construction. Excavations will be made in strict adherence to OSHA regulations. The backfill material will be placed in lifts not exceeding 8-inches in thickness and compacted until the designed subgrade elevations in the area are attained. The backfilled material will be "stair-stepped" laterally into the native material as shown in Detail 3J-2 below. The surface of each of the steps in the surrounding subgrade will be scarified to maximize bonding between the new and old sections.

Lift construction details are depicted in Figure 3J-1. The width of the lift construction will be dependent upon the cell area that will be constructed

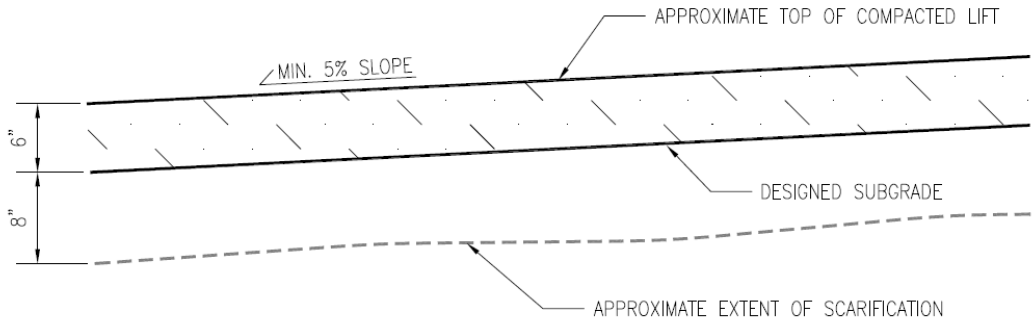

**Figure 3J-1: Detail for Overexcavation and Recompaction of In-Situ Soils**

The moisture content of the materials shall be uniform and within 2% of optimum value as determined by ASTM D 2216. Required laboratory and field QA/QC tests, collection frequency and passing requirements are presented above in Table 3J.1. Modeling of the alternative caliche (prescriptive) liner is provided in Appendix 3I, Attachment 2.

Compaction of the subgrade and the 6-inch caliche shall be performed with a pad-footed or prong-footed roller only. The soil liner shall not be compacted with a bulldozer, rubber-tired roller, flat-wheel roller, scraper or any tracked equipment unless it is used to pull a footed roller.

Determination of density and water content in the field shall be in accordance with the requirements of ASTM D 6938 (nuclear methods). Control of the soil placement shall consist of field inspection and testing to determine that the subgrade and the 6-inch caliche liner has been compacted to the required density and at the proper moisture content. Should any portion of a lift not conform to the density and moisture requirement, the lift shall be scarified, moisture conditioned as necessary, and re-compacted until the required density and moisture content are obtained.

Rocks and caliche clods greater than 1-inch in diameter shall total no more than 10% by weight. The caliche surface shall contain no material larger than 3/8-inches in diameter. The constructed subgrade and caliche shall be "stair-stepped" into an underlying formation of sufficient strength to ensure stability of the constructed liner

system. The surface of each of the steps in the "old" liner shall be scarified to maximize bonding between the "old" and "new" liner material. See Figure 3J-2 for depiction of the "stair-stepped" construction method. It should be noted that for the 6-inch caliche layer, there will only be one "stair-step".

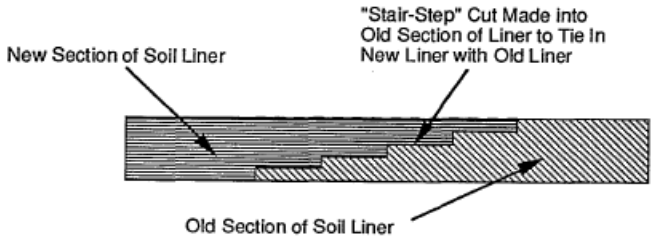

**Figure 3J-2: Tie-in of Soil Liner System (Typical)**
**Source of Figure: Figure 2.2, Quality Assurance and Quality Control for Waste Containment Facilities, EPA Technical Guidance Document 600/R-93/182, September 1993, p. 22**

The completed compacted caliche soil liner must be protected against material drying, desiccation, rutting, erosion and ponding water. Any areas of noted damage shall be re-worked, re-compacted and re-tested.

The thickness of the in-place caliche will be verified by standard survey methods, using the same grid pattern and frequency (1 survey point per 5,000 square feet of cell liner limits) as the subgrade survey to verify that a finished, compacted thickness of at least 6-inches of caliche are in place.

The surface of a constructed soil liner should be covered or otherwise protected within a period of six months to mitigate the effects of dessication, surface erosion, and rutting due to traffic. Liner surfaces not covered within six months shall be checked by the POR and/or POR representative, who shall then submit a letter report on the findings to the TCEQ. Required repairs shall be performed promptly. A new report shall be submitted on the new construction for all liners that need repair due to damage.

## 3J.8.3 Alternative Primary Liner – GCL

In instances where caliche material is not available (or not cost effective to obtain) for Landfill cell construction, GCL may be used. GCL is a manufactured hydraulic barrier consisting of clay bonded to layers of geosynthetics. The GCL shall be reinforced with a layer of sodium bentonite between a woven and a non-woven geotextile that are needle-punched together. Modeling of the alternative liner compared to the prescriptive liner utilizing the HELP model is provided in Appendix 3I, Attachment 1. Additionally, modeling of leachate migration using the Multimedia Exposure Assessment (Multimed) Model is provided in Appendix 3J, Attachment 1.

Quality control certificates shall be submitted by the GCL manufacturer and include: certificates of analysis for bentonite clay used in GCL production demonstrating compliance with the parameters swell index and fluid loss, and manufacturer's test data for finished GCL products of bentonite/mass area, GCL tensile strength, GCL peel strength, GCL index flux, permeability, and hydrated internal shear strength data demonstrating compliance with these specifications.

Handling of GCL rolls should be done to minimize potential damage. Procedures detailed in ASTM D-4873 (02), "Standard Guide for Identification, Storage and Handling of Geosynthetic Rolls and Samples" should be followed as applicable. Each roll shall be inspected during unloading to identify damage. Damaged rolls shall be set aside for further inspection. The GCL shall be stored in a level, dry and well-drained storage area, and shall be covered and protected from ultraviolet photodegradation and precipitation. Care will be taken during GCL roll loading and unloading so that not damage occurs to the GCL, its core or its protective wrapping. If any protective wrapping is damaged or stripped off the rolls, the wrapping will be repaired immediately or the roll moved to an enclosed facility until it may be repaired. If any of the clay material is found to be lost during transportation or handling, the outer layers of the GCL should be discarded until undamaged product is found. The reminder of the GCL roll will be re-wrapped in accordance with the manufacturer's instructions.

The GCL material physical property specifications are detailed Table 3J.1.

The minimum acceptable dimensions of full-size GCL panels shall be 150 feet in length and 15 feet in width. Short rolls (those manufactured to a length greater than 70 feet but less than a full-length roll) may be supplied at a rate no greater than 3 per truckload or 3 rolls every 36,000 square feet of GCL, whichever is less. A 6-inch overlap guideline shall be imprinted on both edges of the upper geotextile component of the GCL as a means for providing quality assurance of overlap dimension.

Installation shall not begin until the base has been properly prepared. The surface shall be maintained in a firm, clean, dry and smooth condition during liner installation. The GCL shall be oriented and installed with the non-woven side facing up. The panels shall lie flat on the underlying surface, with no wrinkles or folds, especially at the exposed edges of the panels. Equipment that could damage the GCL shall not be allowed to travel directly on the GCL, and the cover material (geomembrane) shall be placed immediately over the bentonite GCL.

As the GCL is installed, all overlapping panels shall be inspected to ensure that a minimum of 6-inch overlap exists. For any overlapping panels that are parallel to the slope, the upslope panel shall "single" over the downslope panel with a minimum of 24-inches of overlap. In addition, the GCL shall be inspected for any tears or punctures and repaired or replaced as deemed necessary by the POR.

## 3J.8.4 Geogrid and Bedding Sand

Scenario 3 described in Section 3J.1 includes 2 layers of uniaxial geogrid. Geogrids are reinforcement geosynthetics formed by adjoining longitudinal and transverse ribs. The geogrid layers are installed in areas of "piggy-back" Landfill development and underlie the GCL layer. A layer of free-draining bedding sand (buffer sand) no less than 6-inches thick will be placed between 36-inch compacted onsite soil and the primary uniaxial geogrid. The buffer sand will meet the specifications included in Table 3J.1. The buffer sand will be smooth-rolled and free of any rocks, debris or organic matter.

The POR or POR representative will inspect the delivered geogrid to verify it is the proper and intended material. The POR or POR representative will verify the geogrid

identification labels and coding and inspect the rib joining, thickness and aperture size. If the geogrid has a primary strength direction, it must be indicated on the material.

The geogrid shall have a minimum tensile strength of 3,500 pounds per foot at an allowable stress of 5% or less over 50 years. Material conformance specifications are included in Table 3J.1. The geogrid installation contractor will demonstrate experience of at least 3 projects of similar construction and scope. The geogrid will be stored, handled and installed as specified in the manufacturer's recommendations and current industry standards. At a minimum, the geogrid installation requirements will include:

- Deployment will occur from the top of the slope downward, so that the geogrid is taut before the GCL is placed.
- Reinforcement shall be placed side by side with no overlap.
- The geogrid will end in an anchor trench as shown on Drawing P3-29.
- The roll ends will be connected with Bodkin connection only.
- The geogrid material shall be restrained from moving out of alignment during and after placement. Alignment shall be maintained by securing each reinforcement strip to the ground with stakes or anchoring by hand placing a small quantity of fill on top of the reinforcement prior to placement of the GCL.
- The reinforcement strips shall be pulled taut to remove slack. Stakes should be driven through the reinforcement apertures, or fill should be placed on top of the strips.
- The construction schedule shall allow only the amount of geogrid needed to complete immediately pending work in order to minimize unnecessary exposure to reinforcement.
- Overlying GCL placement shall proceed from the bottom of the slope upward.
- Construction equipment will not be permitted to drive directly over the geogrid.
- Geogrid roll connections on the side slopes shall be avoided. Connections will be located as close to the bottom of the slope as possible.

The POR or POR representative will also oversee the installation of the geogrid and approve connection methods. If additional conformance testing is required, the POR or POR representative will oversee sample collection, frequency and testing methodology.

## 3J.8.5 Secondary Liner – 60 mil HDPE Geomembrane

The liner system consists of a primary (caliche or alternative GCL) liner and the overlying secondary liner, which will consist of a 60-mil HDPE geomembrane. The geomembrane will be textured on both sides to ensure structural stability. The POR and/or POR representative will provide continuous construction oversight during the deployment of the geomembrane and will directly oversee testing of trial welds, seams and repairs. Documentation retained during the installation of the geomembrane will be used in preparation of the soil and geomembrane liner evaluation report (SLER and GLER).

Material conformance documentation will be provided by the contractor or the contractor's selected geomembrane manufacturer to the POR prior to material delivery to the site. Documentation provided will be reviewed by the POR to ensure the proposed material meets the properties specified in Table 3J.1, along with any other material requirements listed in the construction project specifications. Once the intended geomembrane material is approved for use by the POR for the construction project, the geomembrane may be shipped to the construction site.

The geomembrane rolls shipped to the site will be handled, transported and stored in accordance with the geomembrane manufacturer's recommendations, standard industry practices and as designated in the construction project specifications. Each roll will be identified with the manufacturer's name, product identification, thickness, roll number, roll dimensions and the date manufactured. The POR or POR representative will inspect the delivered rolls and will be provided with a roll inventory from the contractor. The POR or POR representative will verify the geomembrane rolls are stored and handled in accordance with the manufacturer's recommendations and observe that:

- Designated equipment used to unload and store the rolls do not have the potential to damage the liner material.
- The rolls are stored in a suitable location and not stacked more than 5 rolls high.
- The rolls are protected from potential puncture, dirt, grease, water accumulation, moisture and excessive heat.

The contractor will submit the qualifications of their selected geomembrane installer to the POR for approval. Geomembrane installation contractor qualifications will be described in the construction project specifications. At a minimum, these qualifications shall include:

- Sufficient production capacity and qualified personnel to meet the demands of the work.
- Approval or licensing of the geomembrane installer by the geomembrane manufacturer.
- Proven qualification by personnel performing the seaming operation by successfully passing seaming tests.
- A minimum of 1 million square feet of experience seaming geomembrane using the same type of seaming apparatus to be used for this work by the "Master Seamer".

Once approved, and prior to the geomembrane deployment, a meeting will be held at the construction site with a minimum of the POR and/or POR representative, the contractor and the approved geomembrane installer in attendance. Installation methods, testing frequency, nonconformance procedures, deployment layout, schedule and personnel contact information will be discussed, at a minimum. Prior to geomembrane deployment, the geomembrane installer will inspect the prepared surface to ensure it is suitable for liner installation, and will certify it in a subgrade acceptance form. If caliche is used as the primary liner, it should be smooth drum rolled, free of irregularities, ruts, soft areas, loose soil, stones, protrusions or any objects that could damage the geomembrane. If GLC is used as the primary liner, the

material integrity will be inspected, and the surface should be clean, and kept free of irregularities or any debris or wind-blown material.

The POR or POR representative will observe geomembrane deployment procedures and facilitate sample collection and testing. Geomembrane rolls shall be deployed by equipment that will unroll the geomembrane without damaging, crimping or stretching the material and that will not damage the underlying material. The geomembrane will not be installed on frozen subgrade. If GCL is used in the liner design, deployment equipment will not be permitted to ride directly over the GCL. If the geomembrane panel must be adjusted once placed upon the GCL, the panel must be moved by hand or using a small pneumatic, tired lifting unit. Tire inflation pressure should be limited to 40 kPa (6 psi) or less over the GCL. If there are any folds, wrinkles or other undulations in the GCL, they will be removed prior to placement of the geomembrane.

The POR and/or POR representative will remain onsite during geomembrane installation. The panels will each be uniquely identified and the location of each panel recorded on a drawing. All panels must be anchored with sufficient ballast to prevent wind uplift. Restrictions will be placed on the liner installation personnel to minimize the potential for damage to the liner, such as smoking or wearing damaging shoes. No more panels will be deployed than can be seamed on the same day.

During geomembrane deployment, the POR and/or POR representative will:

- Observe handling, storage, and installation procedures used for geomembrane liner to verify conformance with manufacturer's instructions and construction specifications.
- Verify that equipment used in geomembrane installation and testing is operating properly.
- Verify that installer is performing trial seaming and field testing at the required frequencies.
- Inspect geomembrane during placement for defects and damage. Notify the contractor for repairs.
- Observation to ensure the unrolled geomembrane has adequate and appropriate ballast to prevent uplift from the wind without causing damage to the geomembrane.
- Observation of the weather conditions (i.e., temperature, humidity, precipitation and wind) to ensure they are acceptable for geomembrane placement and seaming.
- Inspect to ensure the leading edge excavation of the anchor trench excavation is rounded and the dimensions are as specified.
- Inspect to verify proper slack is incorporated into liner sheet installation to accommodate effects from temperature changes.
- Document the construction using field notes and photographs.
- Verify that the installer is documenting all necessary information. Make periodic reviews of installer's documentation.
- Locate, identify, and send seam and material samples to the testing agency for specified tests listed in Table 3J.1.

- Oversee field testing to verify proper procedures and quality construction. Testing frequencies are included in Table 3J.1.
- Review test results from laboratory and field tests. Passing criteria for laboratory and field tests are presented in Table 3J.1.

Panels that are not deployed in accordance with manufacturer's recommendations, standard industry practices and/or as specified in this LQCP or in the construction project specifications shall be marked by the POR representative and be repaired or be removed and replaced by the installer.

The QA/QC program for geomembrane seaming includes preparing trial seams prior to seaming each day as well as throughout the day, inspection and testing of field seams, and repairing seams that fail testing criteria.

Trial seams should be performed daily for each welding machine: before the day's field seaming begins, and once every 4 hours (a minimum of twice per day). Trial seam welds will be inspected by liner manufacturer's site personnel to allow for determination of the optimum welding process parameters based on the prevailing ambient conditions. Trial welds should be at least 5 feet long, and 1½-feet wide. Each trial weld should be marked with the date, time, ambient temperature, number of seaming unit, name of seamer, pass or fail designation, and peel and sheer strength values. The peel and sheer strength values are to be determined using the installer's supplied digital electronically operated tensiometer testing device operated by the installer's personnel and monitored by the POR and/or POR representative. Three peel tests will be performed on each trial seam weld and recorded on the trial seam. The results will be documented and filed on the report forms, and each trial seam will be stored onsite until the GLER is approved by the TCEQ.

The entire length of each field seam weld will be visually inspected immediately after production by the POR representative and the installer's representative. In addition, the entire length of each seam weld will be nondestructively tested and certified for continuity and water-tightness in the presence of the POR representative using air pressure or other appropriate methods. The results will be recorded daily on a Seam Testing Information form. Factory seams are subject to the same testing requirements as field seams.

The air channel that results between the dual bonded tracks will be inflated using a hypodermic needle and pressurized to approximately 200 kPa (30 pounds per square inch(psi)). The designated time period for the seam test shall be no less than 5 minutes. If an unacceptable drop in pressure (4 psi or more) occurs, a number of actions may be taken:

- The distance may be systematically halved until the leak is located.
- The section may be tested by some other leak detection method.
- An extrusion fillet weld may be placed over the entire edge.
- A cap strip may be seamed over the entire edge.

For non-destructive seam testing using a vacuum chamber or vacuum box will be performed by placing a transparent top over the seam. A soapy solution is placed over the seam. A vacuum of approximately 20 kPa (or 3 psi) is then applied. The top is held

over the seam for approximately 10 seconds. When a leak is encountered, the soapy solution shows bubbles, which reduces the observed vacuum. If the vacuum is held and no bubbles observed, the test is deemed acceptable. Vacuum box testing will only be applied in areas where a level testing surface is present. Vacuum box testing will not occur over areas of the leachate collection sumps, anchor trenches, pipe penetrations or any other locations where the vacuum box top will not be able to provide a seal over the test area.

Destructive seam testing may be performed per the construction project specification. The destructive test samples should be cut at least 3 feet in length and 1½-feet wide to provide 3 relatively equal samples: 1 for the independent laboratory to test in peel and shear; 1 for the installer to check in the field; and 1 for an archive sample. The seam should be field tested in peel at the time the sample is taken.

If the field test fails, the seam can either be reconstructed between the failed field test location and any previous passed seam location, or the installer can move to either side of the failed seam location (10-foot minimum), and take another sample for field testing. If the sample passes the field test, a destructive sample is taken from that location and sent for laboratory tests. If the laboratory sample passes the test, the seam is reconstructed between the 2 passing tests. If the laboratory tests fail, the process is repeated until both the field and laboratory samples pass the tests at a location. The seam is then reconstructed in this zone between 2 passed test reconstructed seams. All acceptable seams must be bound by 2 passed tests.

Any samples or in-place destructive testing of geomembrane will require that the area affected be repaired or replaced with material of equal or better quality. Such repair or replacement is subject to the same nondestructive testing as other geomembrane liner seams.

To meet the seaming requirement discussed above, field testing and inspection of geomembrane seaming will include:

- Observation to ensure the seaming materials and equipment are as specified.
- Observation to ensure a firm foundation is available for seaming.
- Observation to ensure the start-up seams prepared by the installer and their testing meet the requirements of the specifications prior to actual seaming.
- Observation to ensure the geomembrane is free from dirt, dust, and moisture.
- Inspection to ensure the overlap of the sheets composing the seam is in conformance with specifications.
- Measurement of the curing time between seaming and seam testing to ensure that it is as specified (when applicable).
- Observation to ensure that all seams are free from visible discontinuities in the seam or any other noticeable defects. Defective areas shall be marked on the liner and on the construction inspection form. All defective areas are required to be repaired in accordance with the specifications.
- Observation of air pressure or other appropriate methods of nondestructively testing field seams to ensure the testing is completed as specified.

- Observation of destructive test sampling to ensure samples are taken at the location and frequency specified.
- Observation of the repair and retesting of seams at failure points in accordance with the specifications to ensure the repaired seams meet the criteria specified.
- Walk-through inspection of the liner after placement of the geomembrane to ensure that equipment or personnel have not damaged the geomembrane during the seaming process.
- Completion of applicable inspection forms.

Repairs, installation and/or material defects in seams, failing destructive and/or non-destructive tests and destructive test sample locations shall be repaired by 1 of the following acceptable repair techniques:

- Patches – used to repair large holes, tears, defects and destructive test locations.
- Extrusion – used to repair small holes, tears, defects, holes from non-destructive tests and seam defects less than ½-inch in length or diameter.
- Capping – used to repair failed seams or seams where non-destructive testing can be performed.

Repairs will be performed in accordance with standard industry practices and will be inspected and logged by the POR representative. The surface of the repair area will be clean and dry. Patching material will be extended at least 6-inches beyond the defect area and, with beveled edges prior to extrusion welding.

Once the geomembrane has been inspected and deemed acceptable by the POR and/or POR representative, the top of the geomembrane liner will be surveyed using the same grid pattern and frequency (one survey point per 5,000 square feet of cell liner limits) as the subgrade if the GCL was used as the primary liner.

The geomembrane will be tested for potential holes and liner defects again after the protective sand layer has been placed over the geomembrane. The leak location detection testing will be performed in accordance with ASTM D 6747.

## 3J.8.6 Protective Sand Layer

A 24-inch thick protective sand layer will be placed over the geomembrane. The protective layer will also act as drainage media, allowing the transport of leachate to the low-lying leachate collection sump area. The intended sand to be used as protective layer will be sampled for material conformance as detailed in Table 3J.1. The POR representative will review the analytical results to ensure compliance with project specifications. The protective sand shall be placed directly on top of the geomembrane using a backhoe or belt conveyor. No construction equipment shall be allowed to operate on the geomembrane without a minimum thickness of 12-inches of sand in place over the geomembrane. The protective sand layer shall be placed using a low ground pressure dozer in accordance with the requirements in Table 3J-2.

Table 3J-2
Construction Equipment Requirements

| Maximum Allowable Equipment Ground Pressure (psi) | Thickness of Overlying Compacted Fill (ft) |
|---|---|
| < 4 | 1.0 |
| < 8 | 1.5 |
| <16 | 2.0 |
| >16 | 3.0 |

The POR representative will observe protective sand layer placement and document construction activities using field notes, surveys and photographs. The POR representative will observe material placement process to ensure the Contractor's equipment does not damage the geomembrane and that the minimum thickness of sand over the geomembrane is as specified for the type of equipment in use. The protective sand shall be placed from the haul road and spread in a manner to minimize wrinkles and stress in the underlying geosynthetics. The protective sand will be placed from the cell bottom to the top along the sideslopes. Any geosynthetic material that has been damaged by the installation of the protective sand layer must be repaired and re-tested using methods described in Section 3J.8.5.

The POR and/or POR representative will review the in-place laboratory testing results to ensure permeability specifications are attained.

Thickness verification of the protective sand layer shall be determined by standard survey methods. The base measurement will be either the top of the geomembrane (if GCL is used for the primary liner) or the top of the finished caliche. A survey of the top of the finished protective sand layer will be performed using the same grid pattern of one measurement per 5,000 square feet of lined area.

## 3J.8.7 Leachate Collection

The leachate collection trench design is described in Appendix 3I. All soil testing and evaluation of either in-situ soil or constructed soil liners shall be complete prior to installing the leachate collection system. An 8-ounce woven geotextile cushion will be placed along the leachate collection trench, on top of the HDPE geomembrane to protect the geomembrane from the overlying leachate collection pipe and drainage aggregate. The POR and/or POR representative will review the contractor material submittal to ensure the product is suitable for geomembrane protection. The leachate collection pipe will be overlain by 12-inches of washed aggregate. An additional 12-inches of washed pea gravel will be placed over the aggregate to act as a filter medium between the protective sand layer and the aggregate. The washed aggregate and pea gravel will meet the material specifications listed in Table 3J.1. The POR and/or POR representative will review the laboratory analytical data to ensure the intended aggregate and pea gravel are in conformance with the material specifications. Additional inspection activities that will be performed by the POR and/or POR representative for the leachate collection aggregate and pea gravel include:

- Field observation to ensure the geotextile cushion material is placed through the entire extent of the leachate collection trench, and the material used is the type and thickness specified.
- Field observation to ensure the filter material is of the type and gradation specified.
- Field observation to ensure the filter material placement follows the specified installation procedures, including the minimum thickness requirements.

The protective sand layer survey data will be used to verify that 2-feet total of aggregate and pea gravel have been placed over the leachate collection trench, along with field verification that each layer of filter material is 1-foot thick.

The leachate collection pipe shall be placed as shown on the design drawings. The pipe shall be joined in accordance with manufacturer and project construction specifications.

Construction equipment shall not be allowed to travel directly over the leachate collection pipes until adequate cover has been placed (see Table 3J-2).

The POR and/or POR representative will review material data sheets to ensure the intended pipe meets construction specifications. During the installation of the pipe, the POR and/or POR representative will:

- Inspect the condition of the pipes and note any defects. Any identified defective pipe must be replaced.
- Observe that construction equipment is operated in a manner to prevent damage to the pipe.
- Inspect the pipe perforations and pipe orientation to verify they are placed as detailed in the construction specifications.
- Observe that the pipes and fittings are joined in accordance with manufacturer and construction project specifications.
- Observe that the pipe is handled and placed in a manner to prevent materials (rocks, debris, vegetation, etc.) from entering the pipe.

## 3J.8.8 Reports

Three copies of prepared construction documentation reports will be submitted to the TCEQ Municipal Solid Waste Permits Section. The evaluated construction project will not be used for waste disposal until TCEQ approval is received. It is expected that TCEQ may respond to the permittee either verbally or by writing within 14 days from the date of submittal listed on the SLER and GLER. If no response is received within 14 days of the SLER and GLER submittal, the report shall be considered accepted and the permittee will begin waste disposal.

Each report will be signed and, where necessary, sealed by the individual performing the evaluation and countersigned by the permittee or authorized representative.

Permanent markers will be installed during the cell construction to identify the extent of permissible waste limits. Once the cell is approved for use, initial waste placement will proceed as detailed in Section 4.9.9.

Preparation and submission of the SLER and GLER shall be in accordance with TCEQ MSWD and will include necessary field reports, laboratory analytical reports and surveys to document the construction methods and test procedures are consistent with this LQCP, TCEQ rules and construction project specifications. At a minimum, the SLER and GLER shall contain the following:

- A schedule and summary of construction activities;
- A summary of all laboratory analytical and field test results;
- Observe that construction equipment is operated in a manner to prevent damage to the pipe;
- Location of field samples and test results;
- Statement of compliance with the LQCP and/or description of deviations from the LQCP and/or project construction specifications;
- Record drawings and surveys;
- Detailed description of temporary dewatering activities as necessary; and,
- Seal and signature of POR and, if applicable, POR representative, in accordance with the Texas Engineering Practice Act.

Any deviations from this LQCP shall receive prior written approval from the executive director.

# Appendix 3J – Attachment 1
# Multimed Modeling Results

SAIC®

# Appendix 3J, Attachment 1
# MultiMed Groundwater Fate and Transport Model for Alternative Landfill Liner Design

## Introduction

SAIC, on behalf of the City of El Paso, Texas has prepared a permit amendment for the vertical expansion of the McCombs Landfill. This vertical expansion within the currently permitted landfill footprint will increase the ultimate waste disposal capacity of the Landfill. In addition to the permit amendment for a vertical expansion, SAIC is proposing an alternative liner design utilizing a geocomposite liner (GCL) liner system. The Multimedia Exposure Assessment (MultiMed) model was completed as part of the alternative liner design to evaluate the potential impacts to groundwater associated with the landfill development and the alternative liner design and to ensure compliance with the contituents listed within Table 1 of 30 TAC §330.331.

## Landfill Liner

The McCombs Landfill currently uses an alternative liner design that was approved on July 10, 1995. The approved liner (referenced as "Scenaro 1") consists of (from bottom to top), 6-inches of compacted subgrade, 6-inches of caliche, 60-mil high density polyethylene (HDPE) geomembrane liner and 24-inches protective soil cover.

The proposed alternative liner design (referred to as"Scenaro 2") for the McCombs Landfill is as follows (from bottom to top):

- 6-inch compacted subgrade;
- GCL;
- 60-mil HDPE geomembrane liner;
- 24-inch protective cover; and
- Waste.

Based on the results of the HELP modeling, the combination of HDPE geomembrane liner with GCL provides a lower permeability barrier system with a leakage rate through the modeled barrier system subgrade of 0.000015 inch per day (in/d) or 1.39E-04 meters per year (m/y). [0.000015 in/d *0.0254m/in * 365d/y =0.000139 m/y].

The HELP model was run to evaluate several scenarios as part of the alternative liner approval and copies of the HELP model runs are provided in Appendix 3I, Attachment 1. Based the on various scenarios, HELP model runs were completed for this permit amendment. The peak daily percolation/leakage value predicted through the GCL subgrade layer of the alternative liner design for each scenario is 0.000015 inch, as depicted in the table below.

HELP Model Runs

McCombs Landfill Alternative Liner Design

Permit Amendment MSW 729B

| Alternative Liner Design | GCL Layer | Peak Leakage Values (inches/day) | Peak Daily Values for Years: | Appendix 3I, Attachment 1 (Page #) |
|---|---|---|---|---|
| Open Conditions: 10 ft MSW, 6" Daily Cover | Layer 7 | 0.000015 | 1 through 4 | 19 |
| Open Conditions: 264ft MSW, 12" Intermediate Cover | Layer 8 | 0.000015 | 1 through 20 | 40 |
| Closed Condition: Prescribed Final Cover | Layer 12 | 0.000015 | 1 through 30 | 72 |
| Closed Condition: Prescribed Final Cover (Sideslope) | Layer 12 | 0.000015 | 1 through 30 | 104 |
| Closed Condition: Final Cover_EVAP | Layer 11 | 0.000015 | 1 through 30 | 128 |
| Close Condition: Final Cover EVAP (Sideslope) | Layer 10 | 0.000015 | 1 through 30 | 156 |

## Site Geology and Hydrogeology

The McCombs Landfill is located on deposits of the Hueco Bolson, probably Camp Rice Formation. These deposits primarily consist of clay, sand, and gravel, with some caliche. The landfill site is underlain by Tertiary and Quaternary basin (Bolson) deposits, overlain by areas of gravel and caliche rimrock. Recent Quaternary alluvial deposits are also present in the Landfill vicinity in topographically low areas.

Boring logs for wells drilled on site to depths greater than 500 feet generally indicate deposits of:

- 0 – 50 feet Sand, and sand and gravel;
- 50-250 feet Sand, with some clay;
- 250-470 feet Sand and fine gravel mix; and
- 470-560 feet Sandy clay.

In general, the relatively clean sands are non-plastic, while sandy clay ranges from low to high plasticity. Permeability tests were not considered necessary based on the soil types encountered during the site characterization. Estimated coefficients of permeability are between 0.01 and 0.04 centimeters per second.

The regional groundwater system in the area primarily consists of the Hueco Bolson aquifers. The Hueco Bolson is divided into the City Artesian area, the Mesa area and the Lower Valley (Leggart, 1962). The Mesa area extends north of the City Artesian area into New Mexico and east to the Hueco Mountains. The Landfill is located within the Mesa area.

Two aquifers occur in these areas: an upper aquifer in the Rio Grande alluvium and a lower aquifer in the Hueco Bolson deposits. Since no known impermeable zone of regional extent separates these aquifers, the Rio Grande alluvium and the Hueco Bolson are considered to be, at least in part, hydrologically connected in the City Artesian and Lower Valley areas (Alvared and Buckner, 1980). The Mesa area primarily consists of Hueco Bolson deposits. Historic withdrawals of groundwater since 1906 for public water supply and irrigation have caused major declines in the water levels. The average water level decline in the Hueco Bolson from 1903 to 1980 is approximately 53 feet (White, 1987).

Locally, recharge to the aquifer occurs due to mountain front infiltration of precipitation from the surface and from the injection of treated sewage into the aquifer from the Hueco Bolson Recharge Project (White and Sladek, 1990). Numerous injection wells were constructed northeast of El Paso and water from the Fred Hervey Water Treatment Plant has been injected into the aquifer by El Paso Water Utilities (EPWU) since the mid-1980s. Since 1991, EPWU has been selling water to El Paso Electric Company for use as cooling water at the Newman Plant, thus less water has been injected into the aquifer (Sperka, 1993).

Based on available information, regional groundwater flow direction in the McCombs Landfill area is to the south-southeast. Groundwater movement in the area is generally less than 1.0 feet per day (White, 1987). EPWU groundwater data indicate that the static groundwater elevation in the area is between 3,670 and 3,675 feet MSL or approximately 370 to 390 feet below ground surface (EPWU, 1993).

Groundwater conditions at the site were determined using data from three groundwater monitoring wells constructed in 2003 around the landfill as part of the approved Subtitle D groundwater monitoring system. Water levels data from December 6, 2010 indicates ground water beneath the site occur approximately 390 to 398 feet below land surface, with corresponding elevations of 3,677 to 3,686 feet AMSI. Based on groundwater level measurements at the site, groundwater flow direction is S70° East or to the east-southeast. The site-specific groundwater flow direction correlates with regional groundwater flow direction within the Hueco Bolson aquifer.

Depth to groundwater in the area of McCombs Landfill is approximately 380 to 400 feet below ground surface. The Hueco Bolson aquifer generally contains fresh water in it upper portion and becomes saline at depth (Davis and Leggat, 1965). The Hueco Bolson aquifer is over 200 meters thick (USGS 2003).

## MultiMed Computer Model

MultiMed is groundwater fate and transport moded developed for the United States Environmental Protection Agency (US EPA) to assist in the evaluation of alternative landfill liner designs for Subtitle D landfills.

For this alternative liner design, MultiMed is used to evaluate the impact of landfill leachate seepage containing trichloroethylene (TCE) on groundwater at the point of compliance, approximately 30 feet or 10 meters from the waste limit boundary. The model can be run with seepage through the landfill liner system and the unsaturated zone to the water table, or, the model can be run as a saturated zone model only, evaluating seepage directly to the groundwater. This evaluation was run in both modes (saturated and unsaturated/saturated modes) and results compared.

Parameters may be input into the MultiMed model to reflect the site geology and hydrogeologic properties. The model is divided into seven parameter groups for data input:

- General parameters;
- Source parameters;
- Chemical parameters;
- Unsaturated zone flow parameters;
- Unsaturated zone transport parameters;
- Saturated zone parameters; and
- Well location and time parameters.

The following section documents the input parameters used within this model and the information source and/or assumptions used in this evaluation.

## MutilMed Model Data

### General Parameters

- Application Type - Subtitle D landfills.
- Run Type – The model was run in deterministic mode in which each parameter was assigned a unique value in accordance with the site conditions.
- Source Type – assumed continual steady state flux.
- Aquifer Source Plan Geometry – Gaussian: Treated as enriched along the center line, tapering to each side as in a Gaussian distribution.
- Active Modules – this was run in both Saturated Zone only and Unsaturated & Saturated Zone modules.

### Source Parameters

- Source Area – The source area evaluated was the proposed Section B waste disposal cell. This cell is 217.7 acres in area or 881,000 square meters. Since a source area was defined, the source length and wide was derived by the model.
- Source Infiltration Rate – This rate is generated from Hydrologic Evaluation of Landfill Performance (HELP) model completed for the landfill alternative liner design. The infiltration rate was taken as the seepage through both the HDPE synthetic liner and the GCL or the leakage through the composite liner system into the subsurface. The value used for this model was from an open landfill cell with

10 feet of waste in place and no cover system. The leakage rate for the liner was the peak daily average of 0.000015 inches per day*acre or 0.000139 meters per year (m/y). [0.000015 in/d * 0.025 m/in * 365d/y = 1.39E-4 m/y]

- Outside Recharge Rate – The outside recharge rate can also be derived from the HELP model. Given the arid environment of the El Paso area, the recharge rate was assumed to be near zero and a value of 1E-10 meters per year was used.
- Initial Concentration – This model, per TCEQ direction, was run only for the chemical trichloroethylene (TCE) at an assumed initial concentration of 1.3 milligrams per liter (mg/l).
- Initial Spread of Source – this is derived by the MultiMed model.

### Chemical Parameters

- Per TCEQ direction, trichloroethylene (TCE) was the only chemical evaluated with for this alternative liner design.
- Normalized Distribution Coefficient (Koc) – assumed to be zero (0.00) Dissolved Decay Coefficient – Derived by MultiMed Model.
- Sorbed Decay Coefficient – Derived by MultiMed Model.
- Overall Aquifer Decay Coefficient – Derived by MultiMed Model.
- Acid Hydrolysis Rate – Hydrolysis was assumed to be zero (0.00) or negligible since it is unlikely trichloroethylene would not undergo much hydrolysis unless the environment was very basic or acidic.
- Neutral Hydrolysis Rate – assumed to be zero (0.00).
- Base Hydrolysis Rate – assumed to be zero (0.00).
- Hydrolysis Reference Temperature – model default of 25 C.
- Aquifer Distribution Coefficient – Derived by MultiMed Model.

### Unsaturated Zone Flow

- Selected Flow Layer – One (1) was selected as the unconsolidated deposits beneath the landfill were assumed to one layer of sand.
- Flow Layer Thickness – The flow layer thickness value used was 100 meters. The thickness of unsaturated deposits beneath the lowest landfill liner base elevation (4,022 feet NGVD) and the water table (3,686 feet NGVD (336 feet or 102.4 meters)).
- Saturated Hydraulic Conductivity – 36 cm/hr ($1E10^{-2}$ cm/sec, 3,150 m/y) "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas", prepared by PSC-The Carel Corporation and dated October 11, 1993, Revised: December 2012; Section 4.7.3 Groundwater Flow Gradient and Rate, pg 16-17. A copy of this document is provided in Appendix 3K, Attachment 1 (pages 20-21) of the Permit Modification, McCombs Landfill – MSW 729B.
- Effective Porosity – 0.30 "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas", prepared by PSC-The Carel Corporation and dated

October 11, 1993, Revised: December 2012; Section 4.7.3 Groundwater Flow Gradient and Rate, pg 16-17. A copy of this document is provided in Appendix 3K, Attachment 1 (pages 20-21) of the Permit Modification, McCombs Landfill – MSW 729B.

- Air Entry Pressure Head – Assumed to be zero (0.0); this value is typically zero for coarser soils. (Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993).
- Residual Water Content – Default value for sand (0.43). Table D - Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993;
- vanGenuchten Alpha – Default value for sand (0.145). Table E - Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993;
- vanGenuchten Beta – Default value for sand (2.68). Table E - Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993.

### Unsaturated Zone Transport

- Select Transport Layer – Corresponds to Layer 1 of Unsaturated Zone Flow.
- Transport Layer Thickness - Corresponds to Layer 1 of Unsaturated Zone Flow.
- Longitudinal Dispersivity – Derived MultiMed Model.
- Percentage Organic Matter – assumed to be zero (0.00).
- Bulk Density – Default value for coarse sand (1.69). Table G - Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993.
- Biological Decay Coefficient – Assumed to be zero, i.e. no biological degradation is occurring in the unsaturated zone.

### Saturated Zone

- Aquifer thickness – Hueco Bolson aquifer is over 200 meters thick. For this model, an aquifer thickness of 100 meters was used.
- Mixing Zone Thickness – Derived by MultiMed Model.
- Effective Porosity – 0.30 "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas", prepared by PSC-The Carel Corporation and dated October 11, 1993, Revised: December 2012; Section 4.7.3 Groundwater Flow Gradient and Rate, pg 16-17. A copy of this document is provided in Appendix 3K, Attachment 1 (pages 20-21) of the Permit Modification, McCombs Landfill – MSW 729B.
- Particle Diameter – Derived by MultiMed Model.
- Bulk Density – Default value for coarse sand (1.69). Table G - Texas Water Commission, Alternative Liner Design Handbook, Version 1, 1993.
- Saturated Hydraulic Conductivity – 3,150 m/y (36 cm/hr, $1E10^{-2}$ cm/sec) "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas", prepared by PSC-The Carel Corporation and dated October 11, 1993, Revised: December 2012; Section 4.7.3 Groundwater Flow Gradient and Rate, pg 16-17. A

copy of this document is provided in Appendix 3K, Attachment 1 (pages 20-21) of the Permit Modification, McCombs Landfill – MSW 729B.

- Hydraulic Gradient – 0.0042 "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas", prepared by PSC-The Carel Corporation and dated October 11, 1993, Revised: December 2012; Section 4.7.3 Groundwater Flow Gradient and Rate, pg 16-17. A copy of this document is provided in Appendix 3K, Attachment 1 (pages 20-21) of the Permit Modification, McCombs Landfill – MSW 729B.
- Seepage Velocity – Derived by MultiMed Model.
- Longitudinal Dispersivity – Derived by MultiMed Model.
- Transverse Dispersivity – Derived by MultiMed Model.
- Aquifer Temperature – Assumed 11°C.
- Aquifer pH – Assumed 7.2 standard pH units.
- Fraction Organic Carbon (foc) – assumed to be zero (0.00).
- Aquifer Retardation Factor – Derived by MultiMed Model.
- Aquifer Biological Decay Rate – No biological decay rate modeled.

### Well Location and Time

- Radial Distance to Well – Point of Compliance is approximately 30 feet (10 meters) from waste limit boundary.
- Angle off Plume Axis – For Subtitle D application Angle off Plume Axis is fixed at zero.
- Well Screen Fraction – For Subtitle D application Angle off Plume Axis is fixed at zero.

## Summary and Conclusion

The MultiMed model was run under the parameters and assumptions listed in the preceding section and in both the active model for unsaturated zone and saturated zone and with no retardation or degradation. The results of the SATURATED and SATURATED & UNSATURATED model runs are nearly the same in the predicted concentration at the point of compliance. The predicted concentration of trichloroethylene at the point of compliance, a monitoring point 10 meters directly downgradient of the waste limit boundary for the SATURATED & UNSATURATED model run is 3.265E-04 mg/l (0.0003265 mg/l). The SATURATED ONLY model run has a predicted concentration at the point of compliance of 3.269E-04 mg/l (0.0003269 mg/l). Both model results (0.0003265 mg/l and 0.0003269 mg/l) are below the established standard, US EPA maximum contaminant level (MCL) of 0.005 mg/l for trichloroethylene (TCE).

Based on the results of the MultiMed Model runs, the alternative liner proposed for the McCombs Landfill will meet the requirements of 30 TAC §330.331.

## Memorandum

To: TCEQ

From: Cami Van Abel, SAIC

Subject: Appendix 3J, Attachment 2 – Alternative Liner Modeling (Scenario 1)

Date: March 15, 2013

SAIC has reviewed the attached "Report of Study for Alternative Liner Design Using Single Flexible Membrane Liner, McCombs Landfill, Permit No. 729-A, El Paso, Texas, May 1995" and subsequent revisions dated June 22, 1995 and June 26, 1995. This report was submitted to and approved by the Texas Natural Resources Conservation Commission (TNRCC). The attached Report for the alternative liner modeling for caliche references TNRCC and MSW Permit No. 729A throughout. It should be noted that TNRRC is now Texas Commission of Environmental Quality (TCEQ) and the attached report and data are applicable to the major permit amendment for MSW Permit No. 729B.

Reference to MSW Permit No. 729A should be used synonymously with MSW Permit No. 729B, reference to TNRCC should be used synonymously with TCEQ, and reference to the maximum contaminate levels (Title 31 TAC 330.202) should be used synonymously with 30 TAC §330.331.

Re: McCombs Municipal Solid Waste Landfill
MSW Permit No. 729A
Alternate Liner Design

Dear Mr. Cordova:

On June 1, 1995, the Texas Natural Resource Conservation Commission (TNRCC) Municipal Solid Waste (MSW) Permits Section received a request from the above referenced facility to use an alternate liner design (ALD) pursuant to 30 Texas Administrative Code (TAC) 330.202-Alternate Design. On June 27 and July 6, 1995, clarifications and additional information was submitted to the TNRCC. The proposed ALD consists of a single 60 mil HDPE underlain by a 6 inch compacted caliche on 6 inches of in-situ compacted subgrade. This alternate liner design proposes to replace the currently approved ALD consisting of a double flexible membrane liner with a leachate collection and a leachate detection system. The submitted ALD has been signed and sealed by Danny R. Anderson, P.E. (P.E. # 32062) in accordance with The Texas Engineering Practice Act.

Pursuant to 30 TAC §330.202, Alternate Design:

> Alternate liner designs may be authorized by the executive director if the owner or operator provides a demonstration by computerized modeling (for example, the "Help" and "Multi-Media" models) that show that the maximum contaminant levels detailed in §330.200 of this title (relating to Design Criteria), Table 1 will not be exceeded at the point of compliance. At the discretion of the executive director, a field demonstration may be required to prove the practicality and performance capabilities of an alternative design.

The TNRCC staff has reviewed the submitted ALD and supporting information and has determined that a HELP and Multimed model was submitted in accordance with 30 TAC §330.202. The results of the

P.O. Box 13087 • Austin, Texas 78711-3087 • 512/239-1000
printed on recycled paper using soy-based ink

HELP and Multimed models which are based on the values selected by the consultant and input into the models, indicate that the maximum contaminant levels detailed in 330 TAC §330.200, Table 1 were not exceeded during the remaining active life and post-closure care period.

If you have any questions concerning this letter, please contact Mark Dollins, P.E. at (512) 239-6675.

Sincerely,

Ronald R. Pedde, P.E., Special Assistant
Office of Waste Management
Texas Natural Resource Conservation Commission

# ABSTRACT

A new alternate design liner has been proposed by the City of El Paso for the McCombs Landfill to replace the previous approved alternate design liner. These computer models were made to demonstrate the suitability of the new alternate design liner which consists of single flexible membrane liner (FML) with a leachate collection system. Most of the input data used were identical to the previous alternate design liner computer model which consists of double flexible membrane liner.

Two computerized models were utilized, HELP and MULTIMED, together with equations for leachate head over the liner. Two models of MultiMed programs which consist of Subtitle D and Generic Model were generated to determine the maximum contaminant level when it reached the groundwater. In Subtitle D, the groundwater table is assumed to be located at the bottom of landfill and in the Generic Model it is assumed to be at 1 inch below the bottom of landfill. These assumptions give a very conservative approach since the actual groundwater table is located approximately 106 meters (350 feet) below the ground surface as reported in the suitability study of the McCombs Sludge Disposal Landfill in 1987. Points of Compliance (P.O.C) are assumed to be located at the groundwater table level, 1 meter in down gradient direction from the landfill.

Page 1

The results of Subtitle D model shows the Dillution Attenuation Factor (DAF) of 575 which is far greater than 260 (the minimum value required by TNRCC). From the generic model, DAF value of 4630 is obtained. This value is the maximum value which is reached in the 120 years of landfill life.

Some conclusions have been drawn from this study.

1. The amount of leachate which is assumed to pass through the liner system does not have potential for contamination to the groundwater.

2. The depth of existing groundwater provides further protection from contamination.

# 1. INTRODUCTION

The City of El Paso has decided to propose a new alternate design liner for the McCombs Landfill using single flexible membrane liner. As it is mentioned on the previous approved alternate design liner (ADL), the ADL was proposed due to the existing geologic and site condition of the surrounding landfll area. On site soils and the soil in the vicinity of the proposed landfill are unsuitable to be used as lining materials. The option of importing and processing suitable soils to the site will increase the cost of construction. This alternate design is in compliance with the Title 31 of the Texas Administrative Code (TAC), Section 330.202 which states the following:

Alternate liner designs may be authorized by the executive director if the owner or operator provides a demonstration by computerized design modeling (for example the "Help" and Multi-Media" models) that shows that the maximum contaminant levels detailed in §330.200 of this title (relating to Design Criteria), Table 1 will not be exceeded at the point of compliance. At the discretion of the executive director, a field demonstration may be required to prove the practicality and performance capabilities of an alternative design. Maximum Contaminant Level (MCL), Table 1, can be found on Page 6. The Hydrologic Evaluation of landfill performance (HELP) and Multi-Media Models are programs which model the landfills and the ground-water beneath them. The HELP model utilizes the properties of the soil layers in a landfill, landfill geometric parameters, and the climatic data specific of the area to calculate the amount of leachate

Page 4

in drainage layers of the landfill and the quantity of the leachate which could penetrate the bottom of the liner. The HELP Model also calculates the amount of leachate head on each of the confining soil layers in the landfill.

The Multi-Media Model utilizes the leachate quantity data, unsaturated zone soil parameters, the aquifer parameters, and the geometric landfill parameters to calculate a Dilution Attenuation Factor (DAF) at a specific point outside the landfill boundary. The point outside the landfill boundary may be selected by the modeler and is referred to as the point of compliance (POC). The DAF is the ratio of the initial contaminant concentration in the leachate to the contaminant concentration at the point of compliance.

This study was conducted to demonstrate that the new proposed alternate design liner using a single flexible membrane liner (FML) will provide sufficient protection of the groundwater.

Page 6

# 2. SITE INVESTIGATION

The site suitability study of the municipal sludge sanitary landfill, which was conducted in 1987, was used to provide data for the computer simulations. The above landfill is located beside the proposed Subtitle D landfill. The proposed site of Subtitle D landfill is shown on Figure 1. The summary of the above study is as follows:

## 2.1 CLIMATE AND PHYSIOGRAPHIC SETTING

El Paso lies within the Chihuahuan desert climate region which is characterized by small but variable precipitation, large annual and diurnal temperature ranges, low relative humidity, and abundant sunshine throughout the year.

High summer daytime temperatures, mild winter daytime temperature, low humidity, and moderate winds combine to create an average annual potential evapotranspiration of 79.7 inches.

The proposed landfill site lies on the broad lowland surface of the Hueco Bolson, on intermontane basin typical of the Mexican Highlands subsection of the Basin and Range Physiographic Province. The Hueco Bolson is a north-south trending tectonic trough with basin-fill deposits, extending from southernmost New Mexico through western Texas and into northern Chihuahua. The Hueco Bolson is bounded on the north by the Tularosa Basin (topographically indistinct but hydrologically separate), on the west by the Franklin

Page 7

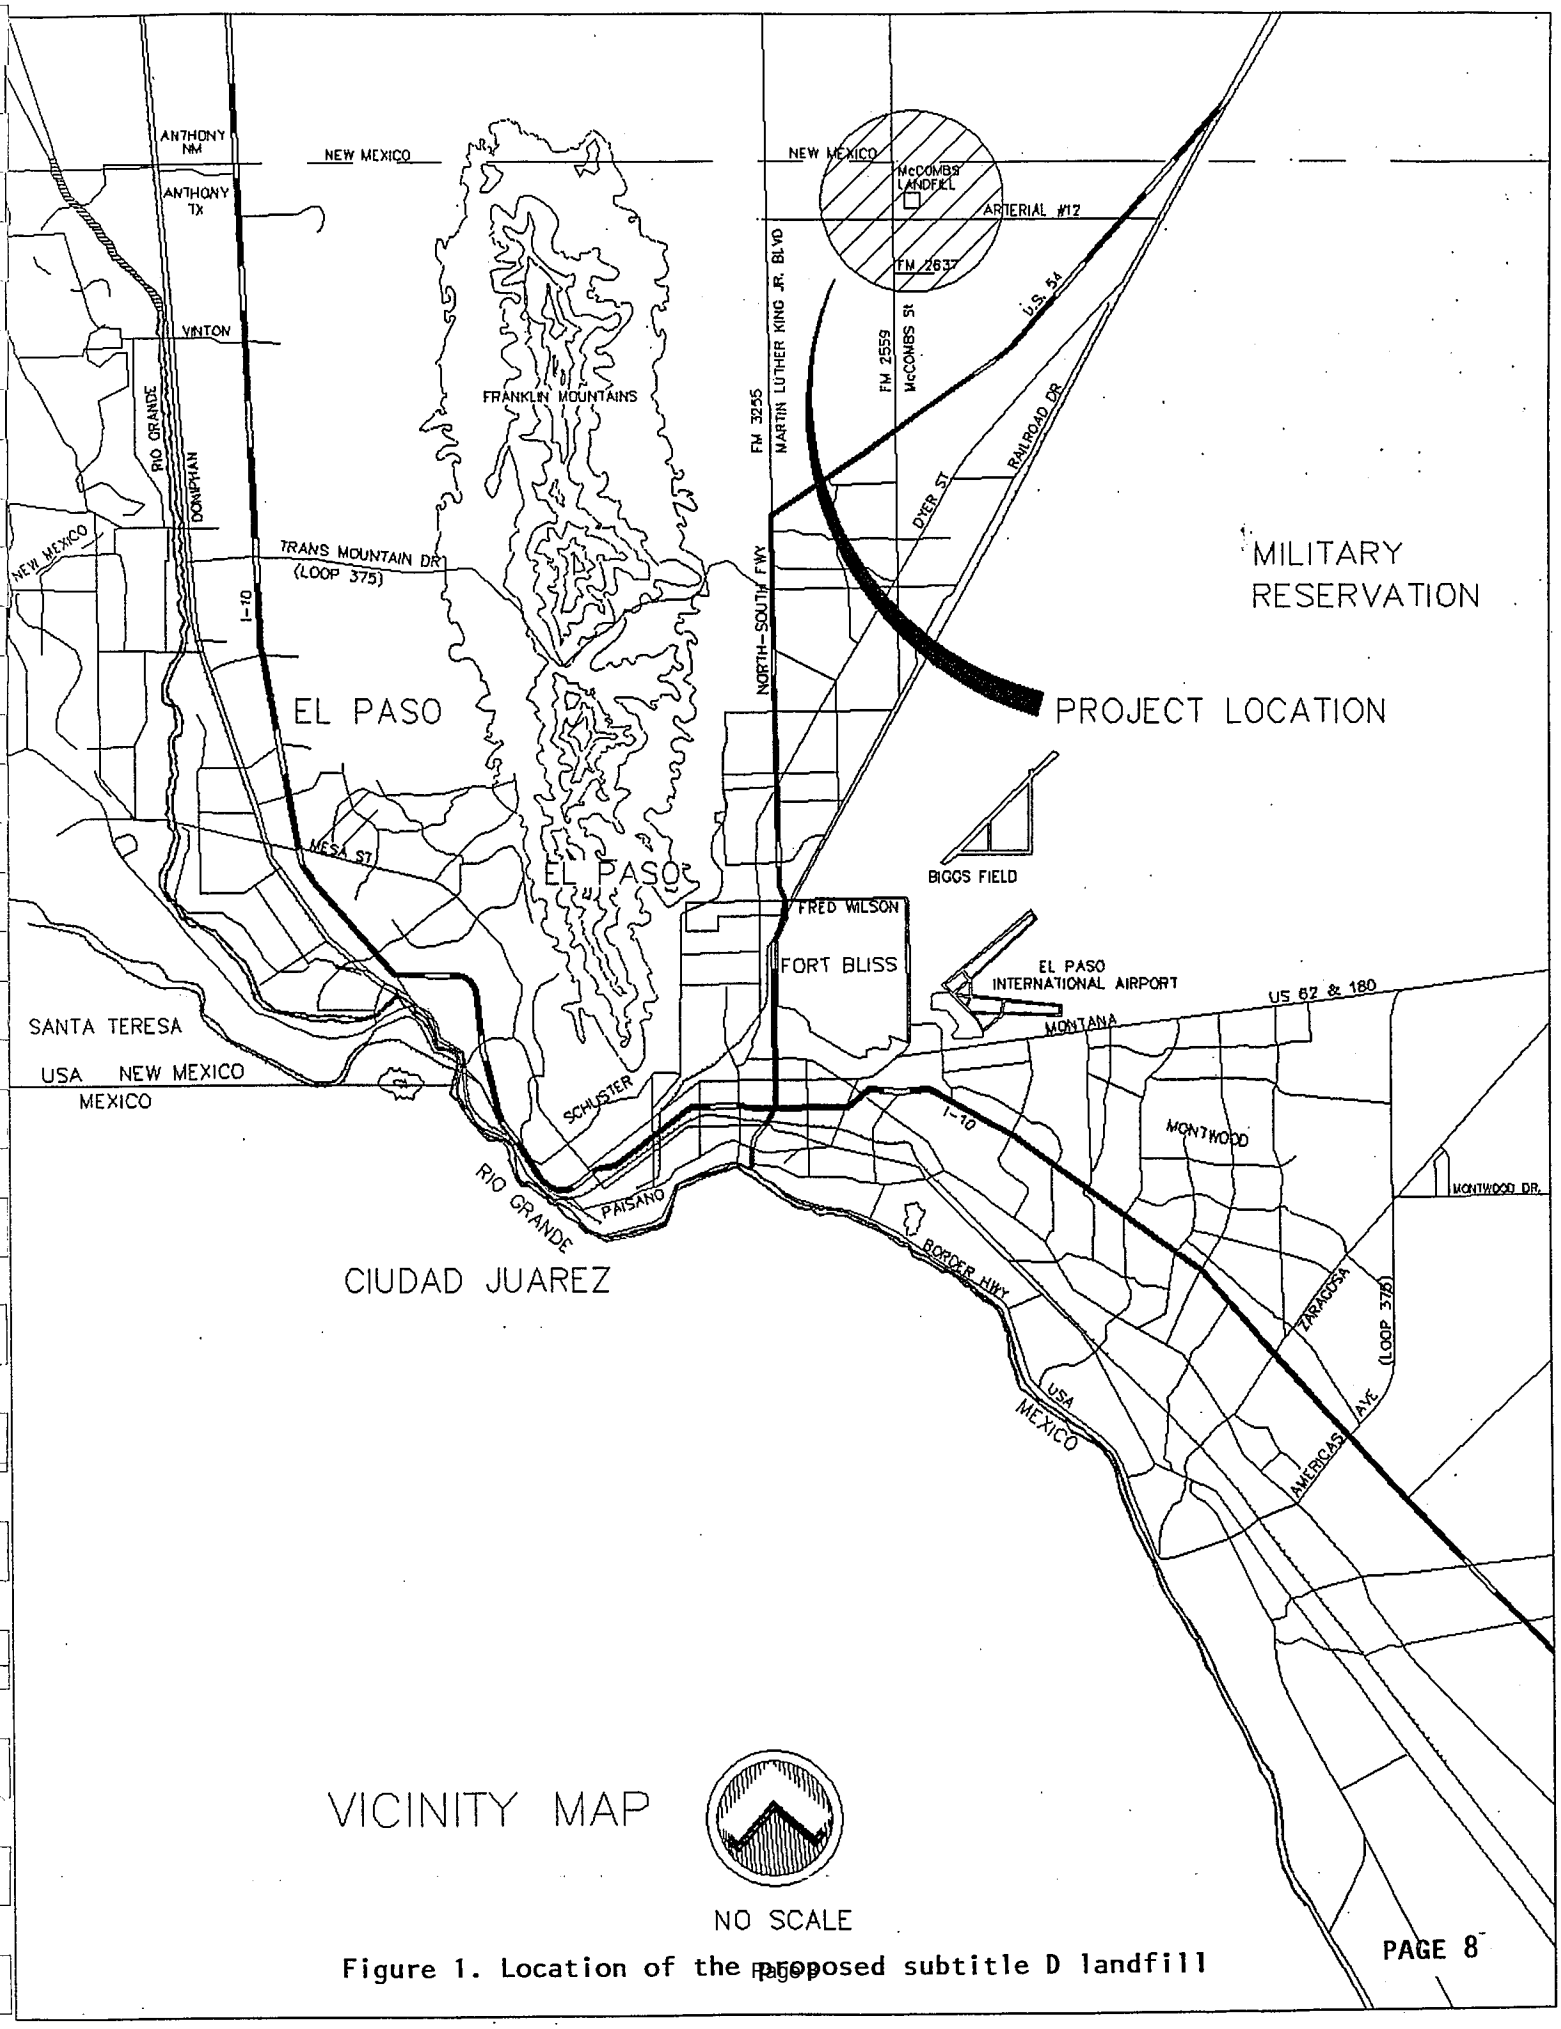

Figure 1. Location of the proposed subtitle D landfill

Mountains (a tilted fault block), on the east by the Hueco Mountains (limestone with some igneous intrusions), and on the south by mountain ranges of the Sierra Madre Occidental Massif.

Basin-fill deposits range up to 2740 meters (9000 feet) deep near the Franklin Mountains. The upper 430 meters (1400 feet) in this portion of the Bolson are predominantly alluvial sands and gravels, thinning to the east. Lacustrine deposits predominate below the fluvial sediments with basement rock of granite and limestone (Figure 2). Alluvial fan and eolian deposits interfinger with both dominant facies at depth and also comprise the more recent surficial deposits. Both facies are considered part of the Fort Hancock Formation, although some assign fluvial gravels in the upper facies as part of the Camp Rice Formation, distinct from piedmont slope alluvial deposits and the lower Lacustrine facies. When crossing the Hueco Bolson, one is aware of the ridge and swale topography which is also evident as aligned depressions on LANDSAT imagery, perhaps representing relict drainage features. Present-day drainage is primarily internal and non-integrated, with rare surface runoff accumulating briefly in playas or small depressions.

An Eastern Boundary Fault Zone (EBFZ) is proposed as separating the Franklin Mountains from the bolson deposits and would be buried under recent piedmont slope deposits and relict landslide blocks (Figure 2). Between 6100 and 7620 meters (20,000 and 25,000 feet) of vertical displacement is said to have occurred along this fault which

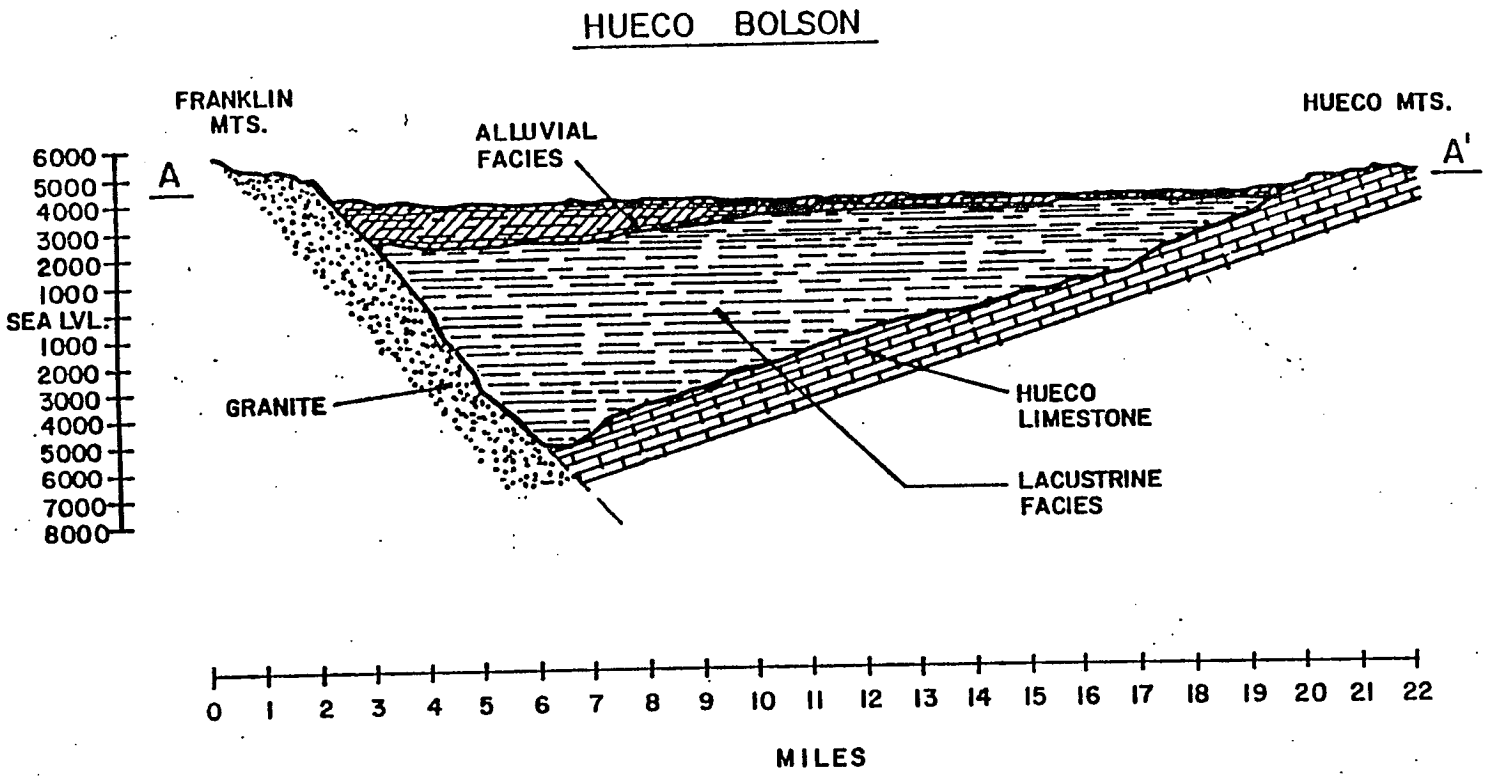

FIG. 2 A WEST - EAST GEOLOGIC CROSS-SECTION OF THE HUECO BOLSON.

dips 25° eastward, based on gravity and seismic data. Movement was initiated during the early Laramide, between 50 and 156 million years ago and has probably decreased ever since. Movement of 122 meters (400 feet) along the EBFZ is suspected since deposition of the upper portion of the Bolson-fill. Westward tilting of the bolson along this fault zone led in part to deposition of the Rio Grande fluvial sediments which thins to the east, (as mentioned earlier), and which today comprise the most productive regional aquifer. The westward tilting along the EBFZ also accounts for the decline in surface elevation of about 61 meters (200 feet) over 13 kilometers (8 miles) from east to west.

## 2.2 SITE CONDITIONS AND SUBSOIL PROFILE

2.2.1 The proposed construction site is located in the Hueco Bolson. The soils in this area are related to the Turney-Berino Association which is described as nearly level and gently sloping soils that have a clay loam subsoil and are moderately deep over soft caliche.

2.2.2 The large deficit between precipitation and potential evapotranspiration restricts vegetation in this region. The potential plant community is made up of grass decreasers as bush muhly, black grama perennial three-awns, plains bristle grass, mesa drop seed and sand drop seed, common invaders are mesquite, creosote bush and brown snake weed.

Page 11

2.2.3 Subsurface soils encountered from 5 test borings are reported in the Appendix. Predominantly three strata of soil material were encountered; silty sand, clayey sand and poorly graded sand. Silty clayey sand is found near the ground surface and extends from the elevation of 4030 feet to 3988 feet while poorly graded sand is found at the elevation of 3988 feet and extends to 3935 feet. Groundwater was not encountered at any of the test boring locations during the time of the investigation.

## 2.3 GROUNDWATER

### 2.3.1 Regional Distribution

Water bearing sediments in the Hueco Bolson are very lenticular in nature, consisting of mixed rounded sands and gravels (left by the ancestral Rio Grande), poorly graded piedmont slope sands and clays (derived locally from granitic outcrops), and well graded piedmont slope sands (derived locally from sandstone outcrops and eolian deposits). Hydrostatrigraphic units of lower permeability involve Lacustrine clays mixed with pebbles of chert (derived locally from outcrops of shale and limestone).

Groundwater is primarily unconfined beneath the broad lowland surface of the Hueco Bolson; this portion of the aquifer is known as the Mesa area. In the Rio Grande Valley between El Paso and Ysleta, groundwater in bolson deposits is semi-confined beneath discontinuous clay lenses left when the river had entrenched 60 to 80 meters (200 to 260 feet) beneath the current valley floor elevation; this portion of the Hueco Bolson aquifer

Page 12

is known as the City Artesian Area. The static water table in the Mesa Area generally ranges in depth below the land surface from 260 to 380 feet dated December 1986. Drawdown in the Mesa Area in the 20 year period, between 1964-1984 ranges from 10 feet in northeast El Paso to 60 feet in the El Paso International Airport, surrounding area (see Figure 3). Disregarding the City Artesian Area median well depth is 168 meters (550 feet) with 67 percent of wells between depths of 90-245 meters (300-800) feet (Figure 4).

2.3.2 Movement

The water table has a hydraulic gradient of about 0.0025 (13 feet per mile) towards a major cone of depression in the vicinity of El Paso International Airport. Groundwater surface contours are provided to illustrate flow directions (Figure 5). Recharge is restricted to deep percolation at the contact between bedrock and alluvium from precipitation of the east slope of the Franklin Mountains. Average annual recharge is estimated at 7.4 million cubic meters (6000 acre-feet), contrasted with 1980 pumpage requirements of 111.7 mcm (90,590 acre-feet). With projected increases in demand for Hueco Bolson groundwater, 75 percent of the volume in storage will be depleted between 1980 and 2030. Transmissivity of the Mesa Area aquifer ranges from 990 to 1980 $m^2$/day (80 to 160 gal/day/ft); vertical hydraulic conductivity is approximately 20 gal/day/$ft^2$; while horizontal hydraulic conductivity is approximately 200 gal/day/$ft^2$; storage coefficient (specific yield) ranges between 0.16 to 0.30; well yields average 9760 $m^3$/day

Page 13

(1.79 gal/min); specific capacity of wells averages 0.5$m^3$/day/m.

### 2.3.3 Quality

The quality of groundwater in the Mesa Area of the Hueco Bolson aquifer is characterized by steady increases in total dissolved solids (TDS) with increasing depth (Figure 3). The thickness of groundwater containing 300-500 mg/1 TDS reaches a maximum of 275 meters (900 feet); the thickness of groundwater with 300 to 2500 mg/l reaches a maximum of 305 meters (1000 feet).

### 2.3.4 Existing Well

The Texas ownership doctrine for groundwater allocation dictates that municipal water supply wells must be located within El Paso City limits or located where water rights have been acquired from the landowner. The ownership doctrine thereby accounts for the high density of wells in the Mesa Area portion of the Hueco Bolson aquifer beneath city land, as opposed to those located beneath Fort Bliss (Figure 5).

Several wells exist in the vicinity of the proposed landfill site (Figure 6). Well #314 is owned by El Paso Sand Products Company, a quarry operation which adjoins the proposed landfill site on the west. The well is drilled to a depth of 142 meters (465 feet). Static water level is approximately 116 meters (350 feet) below land surface. The well is slotted for the entire depth below static water level but no water quality analyses are

Page 14

available.

Hydraulically up-gradient and within a one-mile radius from the proposed landfill site are two existing wells (Well #310 was a USGS test well that was filled in). Well #213 is owned by the El Paso Electric Company and is not oriented along any flow line relative to the proposed landfill site. This well is drilled to a depth of 267 meters (875 feet). Static water level is approximately 102 meters (340 feet) below land surface. The well is slotted for the entire depth below 136 meters (445 feet), discharging water with 797 mg/l TDS (Jan. 15, 1976 measurement). Chloride was reported at a level of 350 mg/l, the only ion to exceed current EPA National Interim Primary Drinking Water Standards. Well #309 is an El Paso City municipal water supply well located 0.32 km (0.2 mile) distant as measured along flow lines. This well is drilled to a depth of 242 meters (795 feet). Static water level is at the elevation of 3689.31 feet approximately 102 meters (335 feet) below land surface (December 1986 measurement). The well is slotted between 155 and 168 meters (510 and 550 feet) and between 186 and 198 meters (610 and 650 feet) depth, discharging water with 505 mg/l TDS (Oct. 6, 1965 measurement). Hydraulically down-gradient and within the one-mile radius from the proposed landfill site are three city-owned wells. Well #305 is drilled to a depth of 184 meters (603 feet) and is 0.2 km (0.1 mile) distant as measured along flow lines. Static water level is approximately 104 meters (340 feet) below land surface. This well is screened between 114 and 152 meters (374 and 1199 feet) depth, discharging water with 436 mg/l TDS (Nov. 1, 1974

measurement). Well #306 is drilled to a depth of 184 meters (603 feet) and is 0.5 km (0.3 mile) distant but not along any flow lines which cross the proposed landfill site. Static water level is approximately 116 meters (379 feet) below land surface. This well is screened for the entire depth below 119 meters (391 feet) depth, discharging water with 1459 mg/l TDS (July 5, 1965 measurement; the chloride and sulfate anions did not meet EPA standards. Well #301 is drilled to a depth of 205 meters (671 feet) and is 1.6 km (1 mile) distant as measured along a flow line. Static water level is approximately 109 meters (358 feet) below land surface (December 1985 measurement). This well is slotted from 98 to 154 meters (320 to 505 feet) and again below 155 meters (507 feet), discharging water with 400 mg/l TDS. Well #303 is owned by Prices Dairy and is not located along any flow lines which intersect the proposed landfill site. This well is drilled to a depth of 265 meters (870 feet) with static water level at approximately 116 meters (380 feet) below land surface (January 1987).

## 2.4 UNSATURATED AND SATURATED ZONE CHARACTERISTICS

### 2.4.1 Unsaturated Zone Characteristics

Subsurface soils encountered from five test borings and three wells (see Appendix A) indicate poorly graded silty sand and clayey sand with low to medium plasticity index are the dominant material in the unsaturated zone.

Page 20

2.4.2 Saturated Zone Characteristics

Static water table is between 102 and 110 meters (335 and 360 feet) below the land surface at the proposed landfill site. This represents a decline in water table elevation of 10 feet to 60 feet during the past twenty years, 1964 to 1984. The water table has a hydraulic gradient (i) of 0.0025, sloping SSW so that groundwater beneath the proposed landfill site moves NNE and SSW. The gradient and direction of the water table surface have also been modified from conditions in 1903, when i = 0.0009 sloping to the east. Within the one-mile radius study area, aquifer transmissivity is 170 $m^2$/day (140 gal/day/ft) for the upper 133 meters (440 feet) of the saturated zone; horizontal hydraulic conductivity is (250 gal/day/$ft^2$). The groundwater flow per unit width of aquifer will be $q_w$=KDi=Ti=(1740 $m^2$/day) (0.0025) = 4.35 $m^3$/day/m.

A standard thickness (d) of 133 meters (440 feet) is used since this is the local thickness of groundwater containing 300 to 2500 mg/l TDS.

Page 21

# 3. DATA AND MODELING CASES

## 3.1 DATA

The normal mean monthly precipitation and normal mean monthly temperature, during a period of 30 years (1961-1990), were used to run the simulation for the HELP program model. These climatological data were obtained from the National Weather Services in El Paso, Texas. The input parameters were summarized and reported on Page 26.

Input parameters for the Multi-Media program consists of two groups of data. The first group of data was used for Subtitle D Model and the second group of data was used for the Generic Model. These parameters were tabulated in Table 3.1 through Table 3.3 for the Subtitle D Model and Table 3.4 through Table 3.7 for the Generic Model. In order to simplify the simulation Model, the Unsaturated Zone layer is assumed to consist of one homogeneous layer (clean sands). As described in Section 2.2.3, the existing unsaturated layer consist of silty sand, clayey sand and poorly graded sand. Thus, it has a lower hydraulic conducitivity value than those of the assumed layer. Therefore, a conservative result will be obtained.

Since the silty clayey materials in the unsaturated zone will decrease, or prohibit the vertical movement of contaminant, the vertical hydraulic conductivity value will not be excessively higher than the horizontal hydraulic conductivity value.

Page 22

The saturated zone is also assumed to consist of one homogeneous layer of sand-coarse material. As indicated in Section 2.4.2, the hydraulic gradient and the thickness of the aquifer were taken as 0.0025 and 133 meters respectively.

The quantity of leachate assumed to be leaking through the liner, which must be estimated to provide the input data used in the Multi-Media Model, was calculated based on the leakage equations in the TNRCC Handbook. This equation has been modified to take into account the thin lining system. The equations used the amount of head on the liner to determine leakage rates. This head value was obtained from the HELP Model.

The above mentioned equations were obtained from the Johnson Ranch II Subtitle D cell, the alternate liner notebook from the City of Odessa, Texas. The alternate liner design was used by the City of Odessa for permit modification of the Johnson Ranch II - Subtitle D landfill on November 1993. The calculation of leachate rates is reported on Appendix C.

The Hydraulic Conductivity of the Flexible Membrane Liner (FML) was assumed to be 5 x 10E-9 cm/sec. This hydraulic conductivity value was estimated based on a study performed by Paula Estornall, a geotechnical engineer at Hart-Crowser Associates in Seattle, WA and Dr. David Daniel (a professor of civil engineering at the University of Texas at Austin) (see Appendix G).

Page 29

## 3.2 MODELING CASES

### 3.2.1 HELP Modeling Run

The proposed alternate design liner consists of 24″ of protective cover, a flexible membrane liner (60 mil HDPE) over 6″ of compacted caliche soil. In HELP Model, 24″ protective cover is functioned as a drainage layer and is underlain by barrier soil liner with flexible membrane liner. The protective cover layer is assumed to be consisting of sand layer with coefficient of permeability of $1 \times 10^{-3}$ cm/sec.

### 3.2.2 Multi-Media Modeling Run

Two models were generated in this program, the Subtitle D Model and the Generic Model. In the Subtitle D Model the program was run based on the steady-state mode. Where in the Generic Model the transient mode was used.

As was mentioned before the unsaturated layer in generic model is assumed consist of 1 m (3.3 feet). This will ensure that a very conservative result will be obtained. The contamination level at point of compliance was investigated in the time frame of 200 years. Where in the Subtitle D Model, the time factor is neglected because it is based on a steady state mode.

Page 30

The points of compliance are assumed to be located on the groundwater table level 1 meter away from the landfill in down gradient direction. The ground water table level is under the assumption that it is located on the bottom of landfill for Subtitle D Model and 1 meter below the bottom of landfill for the generic model.

Page 31

# 4. PRESENTATION OF RESULT

The leachate concentration levels at the point of compliance were calculated by dividing the leachate concentration by the DAF as recommended in the TNRCC Handbook and do not account for the background water quality. These results are reported on Page 34 and Page 35. The Dilution Attenuation Factor (DAF) is calculated by dividing initial concentration (TNRCC=1.0) with the concentration at the Point of Compliance. The location of the Point of Compliance, maximum leachate concentration at POC, and the Dilution Attenuation Factor (DAF) is tabulated in Table 4.1.

| MODEL GENERATED | LOCATION OF POC | CONCENTRATION | DAF |
|---|---|---|---|
| Subtitle D | Bottom of landfill 1 m in down gradient | 0.1738E-02 m | 575 |
| Generic | 1 m below the bottom of landfill, 1 m in down gradient | 0.2160E-03 | 4630 |

TABLE 4.1 CONCENTRATION AND DAF VALUE AT POINT OF COMPLIANCE

The results which were obtained from the Subtitle D Model shows that the DAF values are at the range of 575. This value is obtained at the steady state condition, which is very conservative because it requires that the water entering the flow system be balanced by the water leaving the system. This system also requires that the contaminant source have a sufficiently large mass to ensure that the downgradient concentration once reached will

Page 32

be maintained. Furthermore, it also required that the source contaminant be continuous and constant. This condition will hardly be achieved in the existing site condition.

The concentration level at point of compliance from the generic model shows the value of 4630. This value will be achieved after 120 years with the assumption that the landfill is an active landfill. The relationship between the concentration of leachate at point of compliance relative to time is shown in Figure 7.

Notes:
1. POC contaminant levels are calculated as recommended in the TNRCC Alternate Liner Design Handbook and do not account for background groundwater quality.
2. Leachate concentration levels were obtained from the TNRCC Alternate Liner Design Handbook
3. The flouride concentration was obtained from a Missouri Department of Natural Resources study.
4. No data is available on typical concentration of Methoxychlor, Nitrate, or 1,1,1-trichloroethane.

Page 35

# GENERIC MODEL SIMULATION RESULT

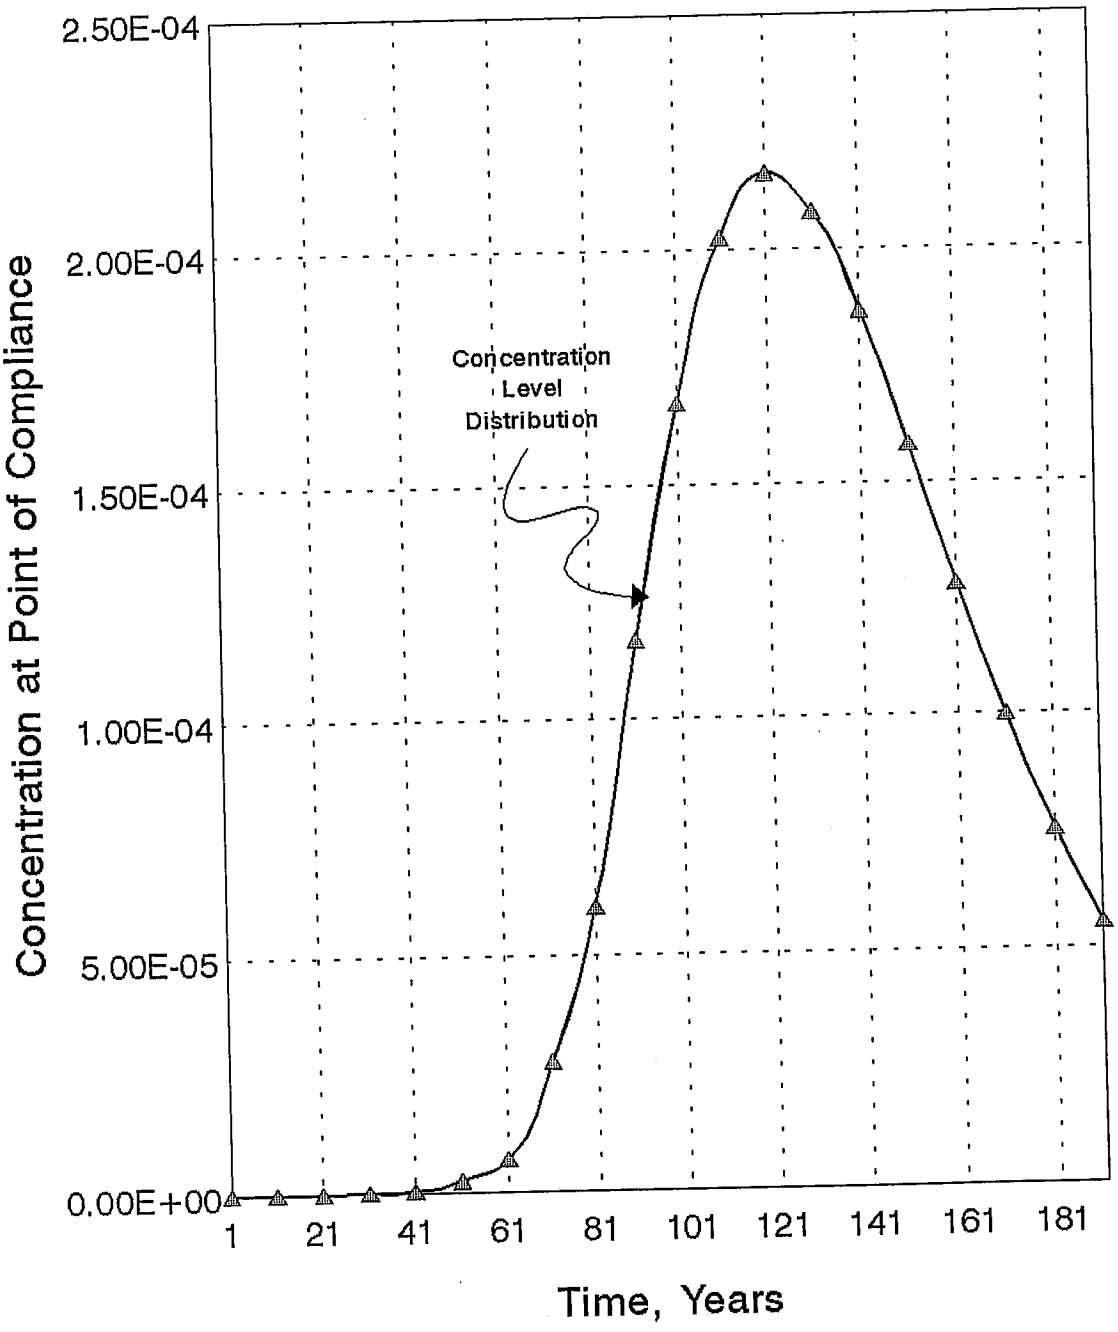

Figure 7. Concentration at Point of Compliance relative to Time

Page 36

# 5. DISCUSSION AND CONCLUSION

None of the concentration levels at the Point of Compliance exceeds the maximum concentration level, which is recommended by TNRCC. The Alternate Design Handbook on Page 24 and 25 indicates that the minimum Dilution Attenuation Factor (DAF) should be 260. Where in this study the minimum Dilution Attenuation Factor is approximately 575. This value far exceeds the above requirement.

The Generic Model result indicates the DAF value at P.O. C. is 4630. These results show that the contaminants have been diluted at least 575 times when it reaches the P.O.C.

The above results indicate that the amount of leachate which passes through the liner system is considered insignificant and it will take more than 200 years to reach the DAF of 575 at the POC, which is located at 1m in down gradient from the landfill and at a depth of 1 m below the bottom of landfill. That is, by assuming that the unsaturated layer consist only of clean sand layer. If the thickness of unsaturated zone increases, the longer the time that is needed by the leachate to penetrate the unsaturated zone.

Page 37

Based on this study, we recommend a construction of Subtitle D cell at McCombs Landfill using an alternate liner. The alternate liner design will consist of a single 60 mil Flexible Membrane Liner (FML) overlain by 24" of protective cover, with a leachate collection system. Consequently, we recommend that no further site specific soil sampling and testing be performed and ground water monitoring be waived.

# APPENDIX C

"HELP" CALCULATION (FLOW)

- Calculation of Leachate on Liners

$$Tmax = L \frac{\sqrt{4(e/k)+\tan^2(\beta)} - \tan(\beta)}{2\cos(\beta)}$$

(TNRCC Alternate Liner Design Handbook, page 9)

where:

Tmax = Maximum thickness of leachate in the leachate collection layer.

L = Length of horizontal projection of the leachate collection layer (meters).

e = Impingement rate (meters/sec).

k = Hydraulic conductivity of drainage layer (meter/sec).

ß = Slope angle of the base of the leachate collection layer (degrees).

e = 0.0045 inches/day = $114.3 \times 10^{-6}$ m/day

$$= \frac{114.3 \times 10^{-6} \text{ m/sec/sec}}{86400}$$

$$= 1.323 \times 10^{-9} \text{ m/sec}$$

L = 270 feet = 82 meters.

K = $10^{-3}$ m/sec = $10^{-5}$ m/sec.

ß = 3%

$$Tmax = 82 \left[\frac{\sqrt{4(1.323 \times 10^{-9}/10^{-5})+\tan^2(3°)}-\tan(3°)}{2\cos(3°)}\right]$$

$$= 82 \left[\frac{\sqrt{5.292 \times 10^{-4} + 274.66 \times 10^{-5}} - 0.0524077}{1.9973}\right]$$

$$= 82 \left[\frac{0.0572346 - 0.052407}{1.9973}\right]$$

$$= 82 \ (0.0024167)$$

$$= 0.1982 \text{ meter} = 0.6503 \text{ feet} = 7.803 \text{ inches}$$

Calculated T max = 7.8031 inches is less than the maximum value of 12 inches (TNRCC Handbook).

- Calculation of Infiltration Rate (Q)

  -assume that FML have a "Good Placement"

$$R = 0.26a^{0.05} \times H^{0.45} \times Ks^{-0.13} \left(\frac{\mu 25}{\mu 15}\right)$$

where

a = area of hole = 0.16 in² = $1 \times 10^{-4}$ m² (TNRCC, Alternate Design, Page 11).

H = Hydraulic head on top of geomembrane liner (meter). (HELP, YIELD - 15 inches) 15 inches = 0.381 meters.

Ks = Hydraulic Conductivity of low permeability soil underlying geomembrane = ($5 \times 10^{-9}$ cm/sec = $5 \times 10^{-11}$ m/s).

$\mu^{25}$ = Viscosity of water at 25°C = 0.000890 (N s/m²)

$\mu^{15}$ = Viscosity of water at 15°C = 0.001139 (N s/m²)

$$R = 0.26(1\times10^{-4})^{0.05} \times (0.381)^{0.45} \times (5\times10^{-11})^{-0.13} \left(\frac{0.000890}{0.001139}\right)$$

= 1.81297 inches

$$L \text{ avg.} = 1 + \frac{H}{2Hs \ \ln(R/Ro)}$$

H = Hydraulic head as top of Geomembrane = 0.381 meters.

Hs= Thickness of low permeability soil = 0.30" = 0.00762 m.

R = from Above = 1.81297 meters

Ro= Radius of imperfection = 0.226" = 0.00574m

$$L_{avg} = 1 + \frac{0.381}{2(0.00762)\ln\left(\frac{1.81297}{0.00574}\right)}$$

$$= 1 + \frac{0.381}{0.087710199}$$

$$= 5.343850594$$

$$Q = Ks\ L\ \pi\ R^2\ \left(\frac{\#defects}{acres}\right)(area) \rightarrow$$

area assume = 22 acres

$$Q = (5 \times 10^{-11})(5.343850594)(3.14)(1.81297)^2\left(\frac{7}{acre}\right)(22\ acres)$$

$$= 424.674 \times 10^{-9}\ m^3/sec.$$

$$Q = (424.674 \times 10^{-9}\ m^3/sec)\left(\frac{31536000\ sec}{year}\right)\left(\frac{1}{19182 m^2}\right)$$

$$= 698.182 \times 10^{-6}\ m/year \quad \text{(MULTIMED INPUT)}$$

$$\approx 0.698 \times 10^{-3}\ m/year$$

NOTES: DEGREE DAYS BASE TEMPERATURE = 65 DEG F; TEMPERATURE UNITS = DEG F;
PRECIPITATION UNITS = INCHES; * = LESS THAN 1 BUT GREATER THAN 0

THE DAILY VALUES PRESENTED IN THESE TABLES ARE NOT SIMPLE MEANS OF OBSERVED VALUES. THEY ARE INTERPOLATED FROM THE MUCH LESS VARIABLE MONTHLY NORMALS BY USE OF THE NATURAL SPLINE FUNCTION. IN LEAP YEARS USE THE FEBRUARY 28TH VALUES FOR THE 29TH AND ADJUST THE DEGREE DAY MONTHLY TOTALS ACCORDINGLY. DAILY PRECIPITATION NORMALS HERE ALSO COMPUTED USING THE NATURAL SPLINE FUNCTION AND DO NOT EXHIBIT THE TYPICAL DAILY RANDOM PATTERNS. HOWEVER, THEY MAY BE USED TO COMPUTE NORMAL PRECIPITATION OVER TIME INTERVALS.

NOTES: DEGREE DAYS BASE TEMPERATURE = 65 DEG F; TEMPERATURE UNITS = DEG F; PRECIPITATION UNITS = INCHES; * = LESS THAN 1 BUT GREATER THAN 0

THE DAILY VALUES PRESENTED IN THESE TABLES ARE NOT SIMPLE MEANS OF OBSERVED VALUES. THEY ARE INTERPOLATED FROM THE MUCH LESS VARIABLE MONTHLY NORMALS BY USE OF THE NATURAL SPLINE FUNCTION. IN LEAP YEARS USE THE FEBRUARY 28TH VALUES FOR THE 29TH AND ADJUST THE DEGREE DAY MONTHLY TOTALS ACCORDINGLY. DAILY PRECIPITATION NORMALS WERE ALSO COMPUTED USING THE NATURAL SPLINE FUNCTION AND DO NOT EXHIBIT THE TYPICAL DAILY RANDOM PATTERNS. HOWEVER, THEY MAY BE USED TO COMPUTE NORMAL PRECIPITATION OVER TIME INTERVALS.

THE DAILY VALUES PRESENTED IN THESE TABLES ARE NOT SIMPLE MEANS OF OBSERVED VALUES. THEY ARE INTERPOLATED FROM THE MUCH LESS VARIABLE MONTHLY NORMALS BY USE OF THE NATURAL SPLINE FUNCTION. IN LEAP YEARS USE THE FEBRUARY 28TH VALUES FOR THE 29TH AND ADJUST THE DEGREE DAY MONTHLY TOTALS ACCORDINGLY. DAILY PRECIPITATION NORMALS WERE ALSO COMPUTED USING THE NATURAL SPLINE FUNCTION AND DO NOT EXHIBIT THE TYPICAL DAILY RANDOM PATTERNS. HOWEVER, THEY MAY BE USED TO COMPUTE NORMAL PRECIPITATION OVER TIME INTERVALS.

# CLIMATOGRAPHY OF THE UNITED STATES NO. 84
## DAILY NORMALS OF TEMPERATURE, HEATING AND COOLING DEGREE DAYS, AND PRECIPITATION 1961-90

## PREFACE

This publication presents daily temperature, heating and cooling degree day, and precipitation normals for selected stations based on the 1961-90 record, adjusted to the present station location. The following elements are presented:

MAX = Maximum Temperature (°F)
MIN = Minimum Temperature (°F)
AVG = Average Temperature (°F)
HDD = Heating Degree Days (Standard Base of 65°F)
CDD = Cooling Degree Days (Standard Base of 65°F)
PCP = Precipitation (Inches)

The stations included in this publication are the National Weather Service Offices and Principal Climatological Stations included in Climatography of the United States No. 81 (1).

The daily values presented in these tables are not simple means of the observed daily values. They are interpolated from the much less variable monthly normals by use of the natural spline function as described by Greville (2). The procedure involved constructing a cumulative series of monthly sums from the monthly normals. The cumulative series was for a 24-month period (July, . . . December, January, . . . December, January, . . . June) so the interpolating function could adequately fit the end points of the annual series. This process was applied independently to all six elements. No normal values for February 29 are included here; in common practice the normal values for the 28th are used for the 29th in each leap year. Thus, for leap years, the February monthly total degree day values are calculated by adding the daily value for the 28th to the printed monthly total. The February temperature and precipitation monthly values are not adjusted for leap years.

The monthly heating and cooling degree day normals (base 65°F) are derived from the monthly normal temperatures using the technique developed by Thom (3), (4). An asterisk (*) for a daily degree day value indicates a daily normal of less than one degree day, but not equal to zero.

Environmental Information Summary C-28 has a more detailed discussion of the daily normals procedure and a discussion of the monthly precipitation probabilities and quintiles.

The EIS C-28 brochure and additional information about the climate of the city listed in this publication may be obtained from the NCDC, Federal Bldg., 37 Battery Park Avenue, Asheville, NC 28801-2733, or by calling 704-259-0682.

# APPENDIX G

# Hydraulic Conductivity of Three Geosynthetic Clay Liners

By Paula Estornell[1] and David E. Daniel[2]

Abstract: The hydraulic conductivity of three 2.9 $m^2$ (32 sq ft) geosynthetic clay liners (GCLs) was measured. Tests were performed on individual sheets of the GCLs, on overlapped pieces of GCLs, and on composite liners consisting of a punctured geomembrane overlying a GCL. Hydraulic conductivities of two of the GCLs were in the range of $10^{-10}$ to $10^{-8}$ cm/s. No flow was measured through the third GCL, but the conductivity was obviously very low ($<< 10^{-7}$ cm/s). The hydraulic conductivities of overlapped GCLs were about the same as those of the control samples with no overlap; an effective hydraulic seal developed along the overlaps in all of the materials tested. Performance of the punctured geomembrane-GCL composites varied—performance was best when the punctured geomembrane was placed directly against bentonite and no geotextile separated the punctured geomembrane from the bentonite. For those GCLs with geotextiles on both sides, problems with migration of bentonite into the underlying drainage layer were encountered when inadequate filtration was provided. However, with a suitable filtration layer separating the drainage layer from the GCL, problems with migration of bentonite were eliminated.

## Introduction

A layer of low-hydraulic-conductivity compacted soil is a required component of most liner and cover systems at waste-containment facilities. In the past few years, several thin, prefabricated, clay blankets, called geosynthetic clay liners (GCLs), have been developed and proposed as an alternative to compacted clay in liner and cover systems. Geosynthetic clay liners may supplement required components in waste-containment units or, as proposed by some, replace part or all of the low-hydraulic-conductivity compacted-soil liner (Daniel and Koerner 1991). Daniel and Estornell (1990), Eith et al. (1990), Grube (1991), and Grube and Daniel (1991) review advantages and disadvantages of GCLs for various waste-containment applications.

The research described in this paper was performed to develop technical information on the engineering properties of GCLs, to determine the hydraulic properties of GCLs and the overlapped seams, and to evaluate the composite behavior of geomembrane-GCL composite liners.

## Geosynthetic Clay Liners

Three geosynthetic clay liners (GCLs) were investigated: Bentomat, Claymax, and Paraseal/Gundseal. A fourth GCL, Bentofix (Scheu et al. 1990), manufactured in Germany, was not included in this study. The three GCLs investigated are shown in Fig. 1.

Bentomat is manufactured by the Colloid Environmental Technologies Co. (CETCO) in Villa Rica, Georgia. The material that was tested consisted of 4.9 kg/$m^2$ (1 lb/sq ft) of untreated, Volclay sodium bentonite ("CS" grade) sandwiched between woven and nonwoven geotextiles that are needle punched together (Fig. 1) to contain the bentonite and to enhance in-plane shear strength.

Claymax is manufactured by the James Clem Corp. in Fairmont, Georgia. The material that was tested consisted by 4.9 kg/$m^2$ (1 lb/sq ft) of sodium bentonite sandwiched between two woven geotextiles (Fig. 1). The lower geotextile is a lightweight, open-weave, spun-lace polyester with large openings. A water-soluble glue is mixed with the bentonite to hold the components together until the GCL has been installed.

Paraseal/Gundseal is manufactured by Gundle Lining Systems, Inc., and Paramount Technical Products, Inc., (see Appendix I) in Spearfish, South Dakota. The material that was tested consisted of 4.9 kg/$m^2$ (1 lb/sq ft) of sodium bentonite mixed with an adhesive and attached to a 0.5 mm (20 mil) thick high-density polyethylene (HDPE) geomembrane (Fig. 1). Material tested in this study was Paraseal, but Paraseal and Gundseal are functionally identical.

Geosynthetic clay liners are manufactured in panels with widths of 4–5 m (13–17 ft) and lengths of 25–60 m (80–200 ft). The panels are placed on rolls at the factory and unrolled at the time of installation. The panels are overlapped 75–225 mm (3–9 in.) during installation and are said to be self-sealing at the overlap. Fig. 2 shows a sketch of the overlap zones. In the case of Bentomat, additional sodium bentonite is placed along the overlap at a rate of 0.4 kg/m (0.25 lb/ft). The bentonite penetrates the pores

Note. Discussion open until March 1, 1993. To extend the closing date one month, a written request must be filed with the ASCE Manager of Journals. The manuscript for this paper was submitted for review and possible publication on September 20, 1991. This paper is part of the *Journal of Geotechnical Engineering*, Vol. 118, No. 10, October, 1992. ©ASCE, ISSN 0733-9410/92/0010-1592/$1.00 + $.15 per page. Paper No. 2605.

Page 79
G-1

of the geotextiles, and the manufacturer says it causes the material to self-seam when the bentonite hydrates.

Claymax panels are normally placed with the open-weave, polyester backing facing downward (Fig. 2). When the bentonite hydrates, the manufacturer states that the bentonite oozes out through the openings in the geotextiles and causes the material to self-seal.

With Gundseal, the GCL can be placed with the bentonite facing upward or, as shown in Fig. 2, downward. The material is said to be self-sealing at the overlap. Although no mechanical joining of overlapped seams is necessary for any of the GCLs, the HDPE sheets in Gundseal can be welded together along the overlaps, if desired, but a thicker HDPE sheet than the usual 0.5-mm (20-mil) sheet would be required. Gundseal would be placed with the bentonite facing upward if a separate, conventional geomembrane lining is to be placed on top of the GCL.

More information about GCLs is available from the manufacturers and from Schubert (1987), Daniel and Estornell (1990), Shan (1990), Eith et al. (1990), Bruton (1991), Estornell (1991), Grube (1991), Grube and Daniel (1991), Shan and Daniel (1991), and Trauger (1991).

## Experimental Methods

Steel tanks, shown schematically in Fig. 3, were fabricated for bench-scale hydraulic conductivity tests. The tanks measured 2.4 m (8 ft) long, 1.2 m (4 ft) wide, and 0.9 m (3 ft) tall. A 13 mm (0.5 in.) diameter drainage

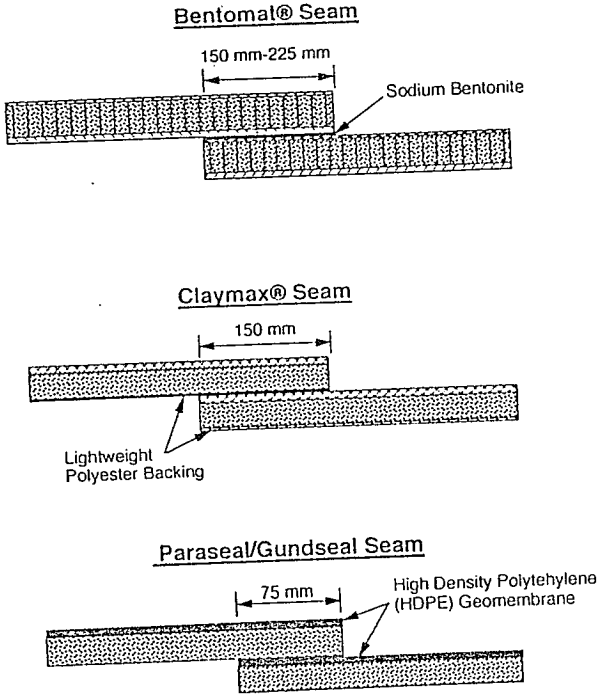

FIG. 2. Configuration of Overlapped Seams with Manufacturers' Minimum Recommended Overlap Width

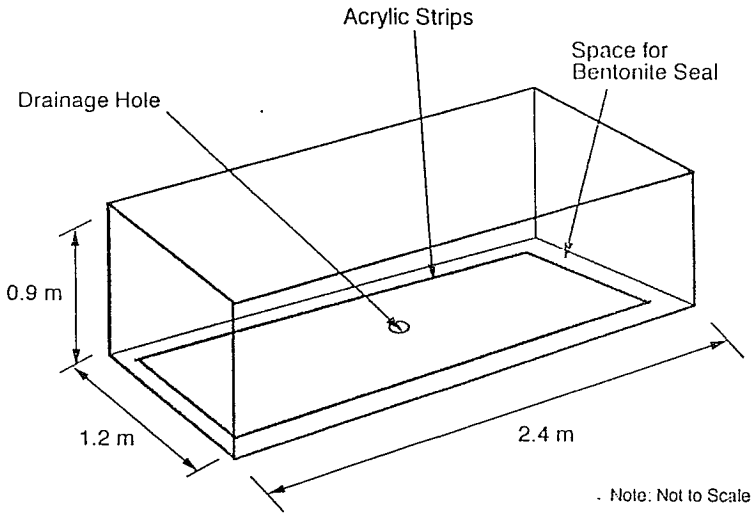

FIG. 3. Orthogonal View of Tank Used for Bench-Scale Hydraulic Conductivity Tests

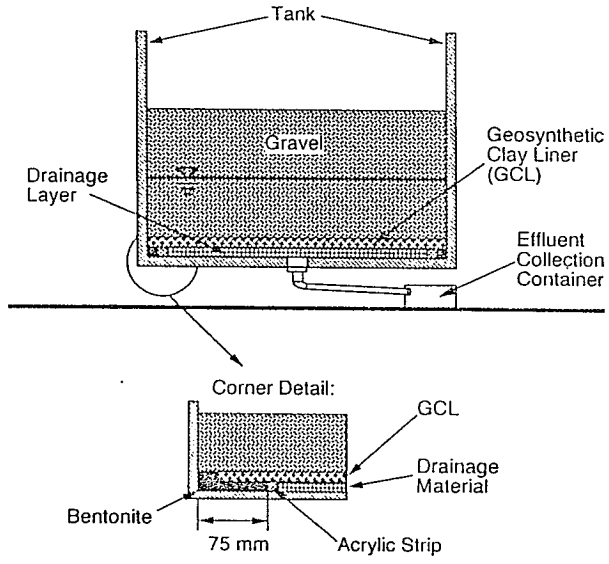

FIG. 4. Cross-Sectional View of Configuration of Materials in Tanks

hole was drilled in the center of the base (Fig. 3) of each tank. The inside walls of the tanks were coated with epoxy. The tanks were raised about 150 mm (6 in.) off the floor with wooden supports.

Acrylic fittings with PVC elbows and flexible plastic tubes were attached to the drainage holes at the bottom of each tank, as shown in Fig. 4. This outlet system provided a closed channel for effluent drainage. In addition, 6.4 mm by 6.4 mm (1/4 in. by 1/4 in.) acrylic strips were glued to the bottoms

of the tanks in a rectangular pattern, as shown in Fig. 3. The acrylic strips provided a 75 mm (3 in.) wide space around the edges of the tanks to retain bentonite that was placed to seal the GCLs against the edges of the tanks.

To conduct a test, a 2.3 m (7.5 ft) long by 1.1 m (3.5 ft) wide sheet of geotextile/geonet/geotextile composite (Gundnet) was centered and placed on the bottom surface of the tank. The Gundnet was cut smaller than the area of the tank to create a 75 mm (3 in.) wide space between the drainage material and edge of the tank to accommodate a bentonite seal (Fig. 4). The geotextile that separated the geonet from the GCLs was a 200 g/cm$^2$ (6 oz/sq yd), nonwoven geotextile with an apparent opening size of 0.15–0.25 mm.

Next, dry bentonite was placed in the space between the drainage material and the walls of the tank. A photograph of the seal and the drainage material is shown in Fig. 5. The GCL being tested was then placed over the drainage composite and bentonite edge seal, with the edges of the GCL either going to the edges of the steel tank (first test set) or within 25 mm (1 in.) of the edge of the tank (subsequent test sets). The spaces between the edges of the GCLs and the walls of the tank were filled with dry bentonite.

Next, a 300 or 600 mm (1 or 2 ft) thick layer of gravel was placed over the GCL with a front-end loader. The gravel had dry and saturated unit weights of 15.4 and 19.3 kN/m$^3$ (98 and 123 pcf), respectively, and a hydraulic conductivity of 5 cm/s (Estornell 1991). The tank was then slowly filled with water over a period of several days. The depth of water was then kept constant. The first set of tests was performed with a 300 mm (1 ft) thick gravel layer and 600 mm (2 ft) of water ponded on the GCLs. These conditions produced a calculated vertical effective stress of 3 kPa (0.4 psi) at the top of the GCL and 9 kPa (1.3 psi) at the bottom. The vertical effective stress was increased in the second and subsequent series of tests by increasing the thickness of gravel to 600 mm (2 ft) and decreasing the water depth to 300 mm (1 ft); the calculated effective stress acting on the top and bottom surface of the GCLs was 8 kPa (1.1 psi) and 10 kPa (1.5 psi), respectively.

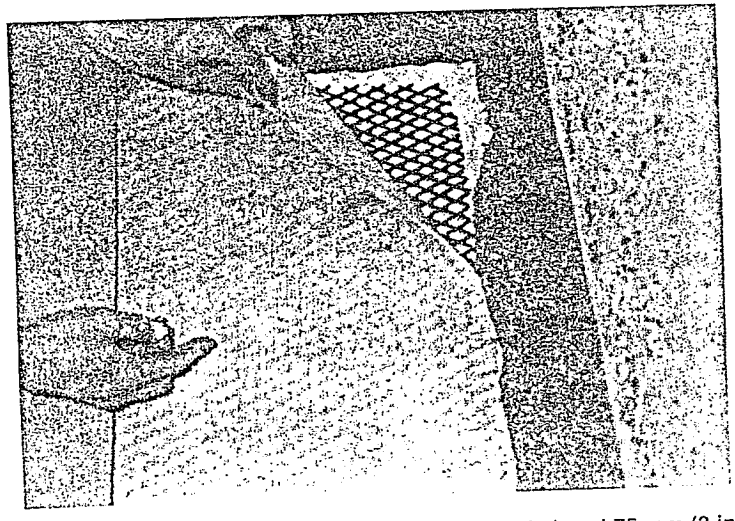

FIG. 5. Drainage Material (Geotextile/Geonet Composite) and 75 mm (3 in.) Wide Bentonitic Edge Seal

Page 81

G-3

Effluent water passing through the drainage hole was collected and weighed to determine the flux of water. Corrections were made to account for evaporation of water from collection pans. Tests were continued until the flux was steady. Except for Gundseal, steady flow was achieved after one to two and a half months, at which point outflow readings varied by no more than ±10%. For Gundseal, no outflow from any of the tanks occurred during more than five months of testing.

Hydraulic conductivity was calculated from Darcy's law for those GCLs that produced flow. It was assumed that the head loss was constant and that the pressure head was zero on the base of the GCL. The hydrated thicknesses of the GCLs (9.4 mm for Bentomat and 16–18 mm for Claymax), which were used to calculate hydraulic conductivity, were determined from laboratory swelling tests. Hydraulic gradient was typically in the range of 30–60.

Three types of tests were performed (Fig. 6). One type of test was a control test on individual sheets of GCL material that had no overlap. The second type of test was on overlapped sheets of GCL material. For Bentomat, sodium bentonite was placed along the overlap at the manufacturer's recommended rate, as shown in Fig. 7. Placement of Claymax overlaps is shown in Fig. 8. Placement of a Gundseal overlap is shown in Fig. 9 for the test with the HDPE facing upward.

At least one test was performed using the minimum overlap width rec-

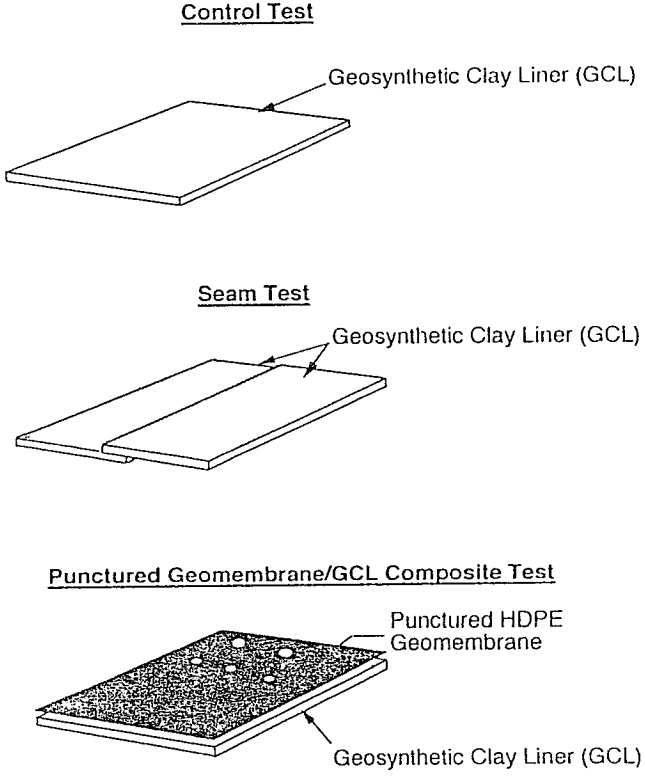

FIG. 6. Schematic Diagram of Types of Tests Performed in Tanks

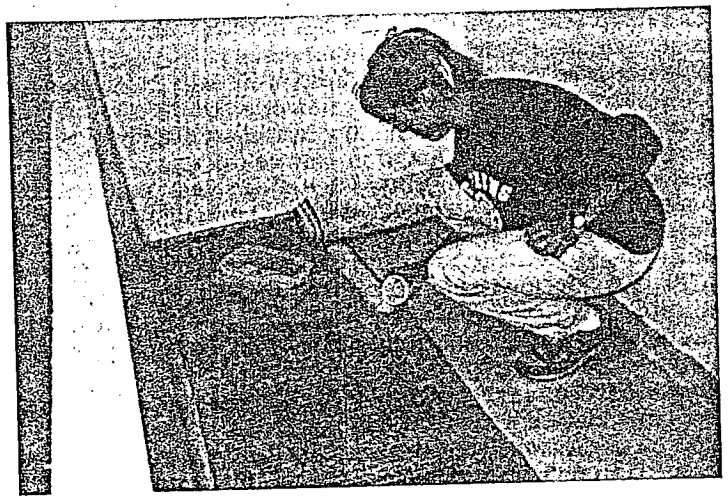

FIG. 7. Placement of Bentomat with Overlapped Seam (Note Spreading of Granular Bentonite along Overlapped Zone)

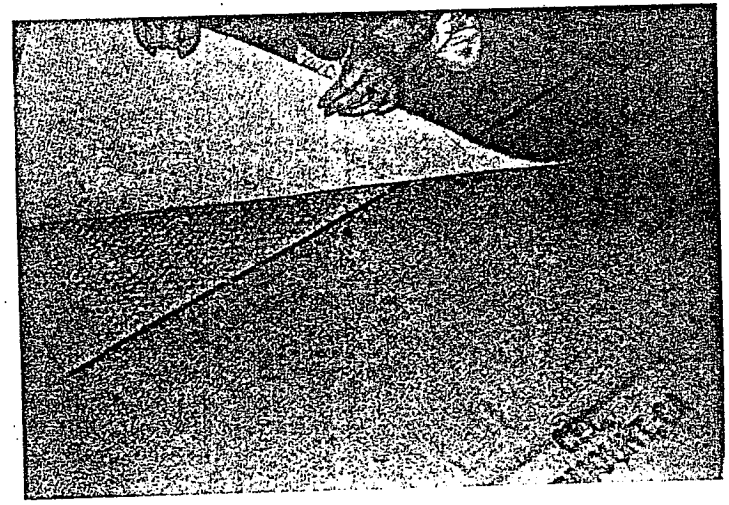

FIG. 8. Placement of Claymax with Overlapped Seam

ommended by the manufacturer [150 mm (6 in.) for Bentomat and Claymax, and 75 mm (3 in.) for Paraseal/Gundseal], and at least one test was conducted using half of the minimum recommended overlap width.

The third type of test (Fig. 6) involved a composite with the GCL overlain by a 1.5 mm (60 mil) HDPE geomembrane. Punctures that were made in the geomembrane included two 75 mm (3 in.) diameter holes, three 25 mm (1 in.) diameter holes, and three 600 mm (2 ft) long slits that were about 1 mm wide (Fig. 6).

Small-scale hydraulic conductivity tests were conducted on 100 mm (4 in.) diameter specimens. Flexible-wall permeameters were used, and pro-

Page 82

G-4

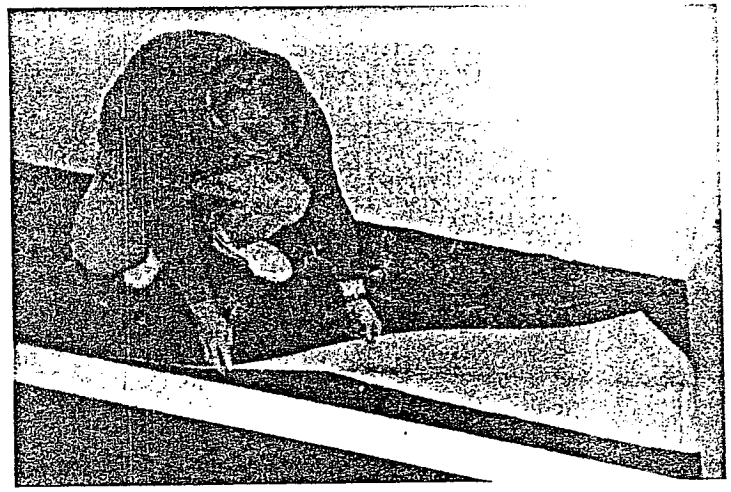

FIG. 9. Placement of Gundseal with Overlapped Seam

cedures outlined in ASTM method D5084 were generally followed. Only Bentomat was tested during this study. Tests on Claymax were performed by Shan (1990) and were not repeated. Hydraulic conductivity data for all the materials were obtained from sources cited in the next section.

## Results of Laboratory Hydraulic Conductivity Tests

The results of flexible-wall hydraulic conductivity tests on the three geosynthetic clay liners are shown in Table 1 and Fig. 10. Hydraulic conductivities of all three GCLs were in the range of $3 \times 10^{-10}$ to $6 \times 10^{-9}$ cm/s. Hydraulic conductivity has a tendency to decrease with increasing effective stress. Individuals who compare hydraulic conductivities of different materials should be careful to compare values measured at the same maximum effective stress.

## Results of Bench-Scale Tests

### Bentomat and Claymax: Tests on Control and Overlapped Samples

Two control tests (no overlapped seam) were performed on 1.2 m by 2.4 m (4 ft by 8 ft) samples. Hydraulic conductivities are summarized in Table 2. The hydraulic conductivity of Claymax measured in the bench-scale tanks compared reasonably well with results of flexible-wall hydraulic conductivity tests performed on small test specimens at similar effective stress. However, with Bentomat, the hydraulic conductivity in the bench-scale tanks was about 10 times lower than values measured in flexible-wall permeameters.

Possible sources of error in the tests on Bentomat were considered. In flexible-wall permeability tests, problems were initially encountered with loss of bentonite near the edges during preparation of test specimens, which led to high flow rates near edges. The problem was minimized by hydrating an oversized test specimen, trimming the moist specimen, and smearing the edge of the test specimen with additional bentonite paste. Despite these procedures, the edge seal may still have been imperfect.

[a]Clay blanket underlain by Trevira 1135 geotextile filter.

In the tank tests on Bentomat, migration of bentonite out of the GCL and into the underlying materials may have reduced the flux of water through the GCL. When the first set of tests was dismantled, grey bentonite was visible in the geotextile/geonet/geotextile composite drainage material beneath both the Bentomat and the Claymax specimens. In the final series of tests, a thick, nonwoven geotextile was placed between the Bentomat and Claymax and the underlying Gundnet drainage composite. The geotextile was a Trevira 1135 fabric with a weight of 356 g/m$^2$ (10.5 oz/sq yd) and an apparent opening size of 0.13–0.21 mm. The thick geotextile filter stopped downward movement of bentonite from Bentomat and Claymax during the three-month testing period: bentonite could be seen on the upper surface of the geotextile filter but not in the bulk of the geotextile nor in the underlying drainage layer. However, with respect to the hydraulic conductivity anomalies, problems with bentonite migration were about the same for Bentomat and Claymax, and yet the comparison of results from tank tests and flexible-wall-permeameter tests was much different (Table 2). The writers were unable to isolate the cause for the discrepancy in hydraulic conductivity of Bentomat measured in flexible-wall permeameters and bench-scale tanks. Further investigation is recommended.

The results of tests on overlapped sheets of Bentomat and Claymax are summarized in Table 3. When the manufacturers' recommended minimum overlap width of 150 mm (6 in.) was maintained, the overall hydraulic conductivity of the overlapped panels was about the same as the hydraulic

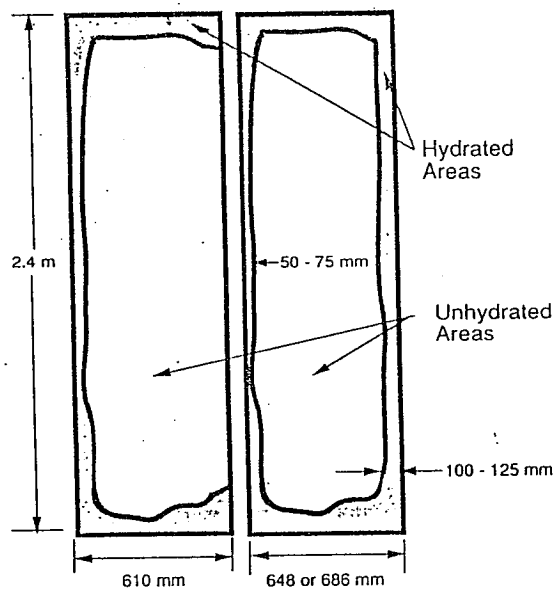

FIG. 11. Pattern of Wetting of Bentonite in Overlapped Gundseal when HDPE Faced Upward

conductivity of nonoverlapped, control panels. The GCLs self-sealed along the overlaps in these bench-scale tests.

When the overlap width for Claymax panels was reduced to half the minimum recommended value, the overall hydraulic conductivity of the overlapped panels was 1.2–9 times higher than the hydraulic conductivity of the control specimens, depending on the vertical stress applied to the specimens. For tests with effective stress greater than 7 kPa (1 psi), the performance of a narrow overlay of Claymax was better than for tests in which a lower effective stress was used. The differences between control and overlapped specimens may simply have been due to variations in the materials themselves; multiple tests for statistical purposes were infeasible due to the great time, effort, and expense associated with each of the tank tests. Intuitively, however, one would expect that the hydraulic integrity of the overlap might be more sensitive to the width of the overlap when the vertical stress is small. Overburden stress is probably needed for the Claymax seams to work because it appears that with little or no overburden, the bentonite simply expands unevenly when wetted and does not ooze through the openings of the geotextile and form a seal.

When the overlap width of Bentomat was reduced to half the minimum recommended value of 150 mm (6 in.), the hydraulic conductivity was 2.5 times greater than the value measured on the control sample with no overlap or the value measured on panels with the minimum 150-mm (6-in.) overlap (Table 3). Again, the difference may simply be the result of material variability. No tests were performed on Bentomat at the lower range of effective stress used for the first test series on Claymax.

### Gundseal: Tests on Control and Overlapped Samples

Five tests were performed on Gundseal. In the first series, the HDPE geomembrane faced upward, the calculated effective stress was between 3

Page 84

G-6

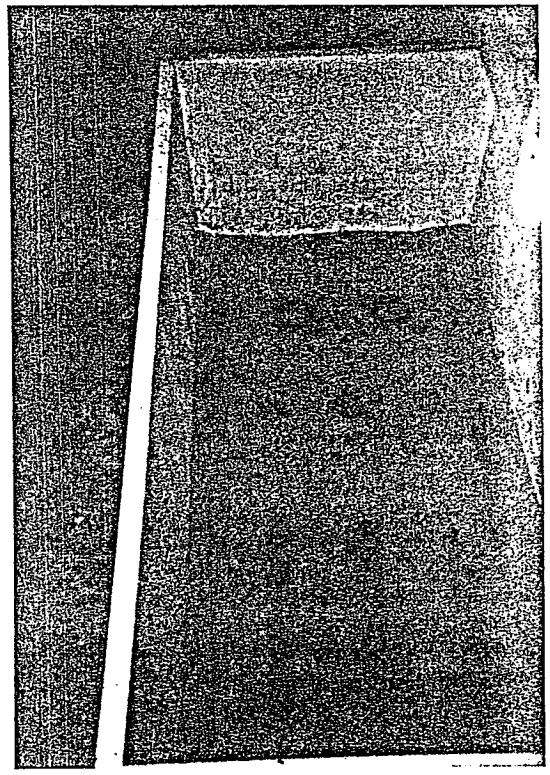

FIG. 12. Pattern of Wetting of Bentonite in Gundseal after Overlying Gravel and Punctured Geomembrane had been Removed from Tanks

TABLE 4. Results of Tests on Punctured Geomembrane/GCL Composites

| Material (1) | Hydraulic Conductivity (cm/s) | | Conductivity ratio: column 3 divided by column 2 (4) |
|---|---|---|---|
| | Control (no geomembrane) (2) | Composite (with punctured geomembrane) (3 | |
| Bentomat | $4 \times 10^{-10}$ | $6 \times 10^{-10}$ | 1.5 |
| Claymax | $7 \times 10^{-9}$ | $7 \times 10^{-9}$ | 1.0 |

and 9 kPa (0.4 and 1.3 psi), and the overlap widths were 75 mm (3 in.) and 38 mm (1.5 in.). A test on a control sample with no overlap was also performed. After five months of testing, no outflow was observed from any of the tanks. The tanks were dismantled, and it was found that the bentonite was wetted approximately 100–125 mm (4–5 in.) around the edges and 50–75 mm (2–3 in.) along the overlap (Fig. 11). Otherwise, the bentonite was not wetted. The tests on overlapped seams indicate that the minimum recommended overlap width contains a factor of safety under these test conditions.

In the second series, two tests were performed with the bentonite facing

upward. The calculated effective stress was between 8 and 10 kPa (1.1 and 1.5 psi), and the overlap width was 0 (control test) or 75 mm (3 in.). After five months, no outflow was detected. There was still some unhydrated bentonite in the overlapped areas at the end of the tests.

### Composite GCL/Punctured Geomembrane

The puncture pattern in the geomembranes that were placed on top of the GCLs is shown in Fig. 2. Vertical effective stress varied from 8–10 kPa (1.1–1.4 psi), and a pressure head of 300 mm (1 ft) of water was maintained on the materials tested.

With Gundseal, water penetrated the bentonite at the defects, but water migrated < 75 mm (3 in.) from the defects over the five-month testing period (Fig. 12). Effective composite action was obvious: the bentonite sealed off defects in the geomembrane and the GCL prevented outflow of water from the punctured geomembrane/GCL composite.

With tests involving Bentomat and Claymax, outflow did occur. An apparent hydraulic conductivity was calculated, assuming one-dimensional flow through the entire cross-sectional area of the GCL; results are shown in Table 4. Hydraulic conductivities of the punctured geomembrane/GCL composites were about the same as those of the GCLs alone. When the tests were dismantled after about three months of permeation, it was found that the bentonite was fully hydrated over the entire area of the Bentomat and Claymax sheets. It is assumed that water flowed through the punctures in the geomembranes, spread laterally through the geotextile that separated the bentonite from the geomembrane, and soaked the GCL. Once the bentonite was wetted, the high in-plane transmissivity of the geotextile that separated the punctured geomembrane from the bentonite provided an avenue for water to spread laterally from the punctures and permeate the GCLs. However, in-plane transmissivity of geotextiles tends to decrease with increasing vertical stress; the vertical stress used in these tests was low.

## Conclusions

Bench-scale hydraulic conductivity tests were performed on three geosynthetic clay liners (GCLs). The purpose of the tests was to determine: (1) Whether overlapped seams self-seal when the bentonite in the GCL is hydrated; and (2) whether the bentonite forms a seal against an overlying, punctured geomembrane. Conclusions drawn from this study are as follows:

1. The GCLs that were placed in large tanks self-sealed at overlaps when the bentonite was hydrated. Except for the case where low (< 7 kPa or 1 psi) vertical effective stress was employed, the hydraulic conductivities of overlapped materials were almost identical to values measured on control samples with no overlap.
2. For tests in which the minimum vertical effective stress was greater than 7 kPa (1 psi), the overlap width could be reduced as much as 50% below the minimum values recommended by the manufacturers without significantly increasing the overall hydraulic conductivity of overlapped panels. For the carefully controlled test conditions employed in this investigation, there was a factor of safety built into the manufacturers' minimum recommended overlap widths.
3. Bentonite was found to migrate vertically out of the two GCLs that contained bentonite between two geotextiles and into the underlying drainage layer when adequate filtration was not provided. Bentonite consistently migrated through a 200 g/m² (6 oz/sq yd), nonwoven, needle-punched geotextile with an apparent opening size of 0.15–0.25 mm and into an underlying geonet. However, bentonite migration was stopped during the three-month testing period by a 356 g/m² (10.5 oz/sq yd) nonwoven, needle-punched geotextile with an apparent opening size of 0.13–0.21 mm.
4. The effectiveness of composite action between a punctured geomembrane and the bentonite in the GCLs depended on whether a geotextile separated the punctured geomembrane from the bentonite. Good composite behavior was observed when the bentonite was in direct contact with the punctured geomembrane; liquid migrated laterally no more than about 75 mm (3 in.) from the punctures. Less effective composite action was observed when a geotextile separated the bentonite from the geomembrane.

# Stress-Strain-Strength Responses of Compressible Chicago Glacial Clays

By Richard J. Finno,[1] Member ASCE, and Choong-Ki Chung[2]

ABSTRACT: The stress-strain-srength responses of compressible Chicago glacial clays are presented.These clays are lightly overconsolidated supra- or subglacial tills. Fixed piston and Shelby tube samples from various locations in the Chicago area were subjected to an extensive laboratory testing program, including index property, consolidation, direct shear, and $K_o$-consolidated, and undrained triaxial compression and extension tests. Results of the experimental program indicated the strengths of tills can be normalized when proper consideration is given to variations in natural water content. The different undrained strengths in compression and extension indicate that the clays exhibit stress-induced anisotropy. Initial undrained elastic moduli of the clays vary systematically with the overconsolidation ratio. Comparisons are made between strengths computed from relations based on normalized undrained strengths determined in the laboratory and those based on in-situ tests made at several locations. These data suggest that field vane strengths represent a conservative index of undrained shear strength for these Chicago clays.

## Introduction

This paper describes the laboratory behavior of compressible Chicago glacial clays. These clays are low-to-medium plastic clays, which are typical of many deposits in the Great Lakes area (Wu 1958). There is a dearth of published information concerning the shearing properties of these clays, which is surprising given the extensive developoment of this area. This paper reviews the geology of the compressible clays, describes the experimental program, and presents the results of conventional index, consolidation, and shear tests, as well as $K_o$-consolidated undrained ($CK_oU$) triaxial compression (TXC) and extension (TXE) tests. Results of these triaxial tests are expressed in terms of normalized soil parameters. Undrained shear strengths based on these normalized soil parameters are compared to results of in-situ tests conducted at the two sites where most of the specimens were obtained.

## Geology of Chicago Clays

The soils in the Chicago area are primarily glacially derived, and only the most recent advance of the continental glaciers left deposits in significant quantities. Bretz (1939) and Otto (1942) suggested that the soil was deposited in six fairly distinct till sheets during the Wisconsin stage of the Pleistocene epoch; in order of deposition, they are the Valparaiso, Tinley, Park Ridge, Deerfield, Blodgett, and Highland Park tills. Otto (1942) identified each till on the basis of water content and unconfined compression strength

point of compliance, $C_p$.

$$DAF = \frac{C_o}{C_p}$$

Therefore, if $C_o$ is equivalent to 1, then with the calculation of the DAF, the predicted concentrations at the Point of Compliance will be dependent on the input leachate concentrations. The TWC has tabulated in Table 2 the recommended input concentrations for use in Multimed (or other fate and transport models) when site-specific-leachate data are not available. Values considered for recommended input concentrations were taken from USEPA's "Draft Background Document Summary of Data on Municipal Solid Waste Landfill Leachate Characteristics: July 1988, and the Toxicity Characteristic Leaching Procedure (TCLP) in 40 CFR §261.62. The greater of the values for each constituent is the recommended input concentration.

For concentrations used in the alternate design demonstration, the designer may:

1. Use the concentrations for the municipal solid waste landfills found in Table 2: or

2. Submit a proposal for a site characterization study for the alternate design.

Values in Table 2 will be revised as more leachate data become available. The designer should contact the TWC prior to commencing with design of a site to ensure the values listed are current or to obtain an updated list.

# LEACHATE CHARACTERISTICS FOR MISSOURI SANITARY LANDFILLS

Lee D. Tharp, P.E.[1]

## Abstract

Leachate management is a crucial issue that must be addressed during landfill design. To compile a detailed database of leachate chemical characteristics, the Missouri Department of Natural Resources (MDNR) ha in recent years required as permit conditions that sanitary landfills sample for and analyze semiannually certain metals and annually for hazardous waste characteristics, in accordance with 40 CFR Part 261. The original goal was to determine if sanitary landfill leachate is characteristically hazardous. The data indicates that it is not characteristically hazardous for the eight inorganic parameters specified in 40 CFR Part 261. The organic parameters required by TCLP for hazardous waste characterization are not included because of the lack of data.

Data from 13 sanitary landfills is provided with a total of 121 sampli events. One of the landfills is in the St. Louis area, although it is on the Illinois side of the Mississippi River. The sampling and analysis of the leachates were done by the individual landfills or the contracted private laboratories. The MDNR did not have requirements o laboratory QA/QC or sampling techniques. Data for two of the landfill was obtained from the local sewer district and was not a requirement o the individual landfill permits. All of the laboratory data is assume to be accurate, however it cannot be confirmed.

The data is presented along with ranges of values reported in the literature. For nearly all parameters the data is on the low side of the range reported in the literature. There is some question about wh methods should be used in sample preparation when analyzing for metals specifically with respect to filtering.

## Introduction

Until the early 1970s land disposal of municipal solid waste was unregulated and uncontrolled in comparison to today's standards.

## Memorandum

SAIC

To: TCEQ

From: Cami A. Van Abel, SAIC

Subject: Appendix 3K, Attachment 1 – Site Characteristics and Monitoring Plan

Date: July 17, 2013

SAIC has reviewed the attached "Site Characterization and Monitoring Plan, McCombs Landfill, El Paso, Texas, October 11, 1993, updated and revised December 2012". The attached Report for the site characterization and monitoring references MSW Permit No. 729A throughout. It should be noted the attached report and data are applicable to the major permit amendment for MSW Permit No. 729B. Reference to MSW Permit No. 729A should be used synonymously with MSW Permit No. 729B.

# EXECUTIVE SUMMARY

A hydrogeologic evaluation of the McCombs Sanitary Landfill was completed by SHB AGRA, Inc. (SHB) in 1993. The object of the evaluation was to develop a suitable groundwater monitoring plan at the subject site in order to comply with requirements set forth by the Texas Water Commission, now known as the Texas Commission on Environmental Quality (TCEQ), under Chapter 330 of the Texas Administrative Code. Parkhill, Smith & Cooper, Inc. and The Carel Corporation prepared modifications to comply with the 2006 revisions of Chapter 330.

The original evaluation program included a review of existing geotechnical, geological, hydrogeological and climatological data for the site. Groundwater data were obtained from federal, state and selected private entities. Details of daily operation were obtained from City of El Paso personnel familiar with the site.

Results of the SHB review indicate that the climate of the El Paso region is characterized by low average annual rainfall and high rates of evaporation. Groundwater is known to occur at depths exceeding 300 feet. These factors suggest an extremely low potential for leachate generation and migration to groundwater.

The original groundwater monitoring system consisted of the installation of three monitor wells at the facility. One located upgradient for background water quality determination, and two located downgradient to detect potential groundwater impacts based on regional groundwater flow direction data. A detailed Groundwater Sampling and Analysis Plan is included as a separate document.

The proposed groundwater monitoring system will be comprised of nine (9) monitoring wells: MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, and MW-9. This will be done by retaining existing wells MW-1, MW-2, and MW-3, converting existing piezometers PZ-4 and PZ-5 to MW-4 and MW-5, and installing new wells MW-6, MW-7, MW-8, and MW-9. It is proposed that monitoring wells MW-6 through MW-9 be installed within 180 days of the approval date of this permit modification. Five (5) additional monitoring wells (MW-10, MW-11, MW-12, MW-13, and MW-14) may also be added to the facility groundwater monitoring system in the event the landfill constructs cells in Sectors B, C, D, and E.

# 1 INTRODUCTION

## 1.1 Background

This report presents the results of a hydrogeologic evaluation of the McCombs Landfill in El Paso, Texas. The purpose of the study was to characterize the operational history of this municipal landfill and to study the geotechnical and hydrogeologic conditions of the site vicinity in order to evaluate the potential for a leachate migration and develop a groundwater monitoring system that would meet Texas Commission on Environmental Quality (TCEQ) requirements.

The TCEQ, formerly known as the Texas Natural Resource Conservation Commission, adopted Subtitle D as published by the United States Environmental Protection Agency (EPA) relating to municipal landfills. As adopted, the regulations required the development of a groundwater monitoring program for large municipal landfills. The State of Texas required submission of a groundwater and/or leachate migration monitoring plan based on a hydrogeologic evaluation of the landfill prior to implementation. The monitoring plan was required for all municipal landfills unless specifically exempted by the TCEQ Executive Director. This monitoring plan includes details concerning the number and location of monitor wells for the facility, construction of the wells, sampling procedures and frequency, and target parameters for chemical analyses.

The City of El Paso (City) contracted SHB AGRA, Inc. (SHB) to evaluate site specific hydrogeological and geotechnical conditions and develop the original monitoring plan for submission to the TCEQ. Subsequently, the City retained Parkhill, Smith & Cooper, Inc. and The Carel Corporation to prepare modifications to the original monitoring plan to comply with the 2006 revisions of Chapter 330.

## 1.2 Purpose & Scope

The objective of this study is to develop a groundwater monitoring plan for the McCombs Landfill within the regulatory framework of the 2006 revisions to Chapter 330 of the Texas Administrative Code (TAC) by the State of Texas and the TCEQ. SHB originally reviewed available background data on the hydrogeologic characteristics of the site area and previous geotechnical investigations completed at the site during the permitting process. On-site conditions and waste disposal practices were further evaluated during a site reconnaissance. A groundwater monitoring program was developed based on regulatory requirements and estimates of the groundwater characteristics at the site.

## 1.3 Project Location & Landfill Description

The McCombs Landfill is located approximately 20 miles northeast of downtown El Paso in Section 6, Block 80, Township 1, Texas and Pacific Surveys. The landfill is situated at the northeast corner of the intersection of McCombs Road and Farm Road 2529 (see Figure 1). The permitted landfill area encompasses approximately 327 acres, although only a portion has been landfilled at present. The City is the Owner and operator of the facility.

The McCombs Landfill was originally permitted as a municipal solid waste landfill on August 13, 1976 under Permit No. 729 for operation on 25 acres. A permit amendment was issued on May 30, 1984, which increased the total permitted area from 25 acres to 327 acres; however, the site development details were only provided for approximately 70 additional acres (landfill cells, Phases I-III) at the time since a quarry operation was active on the remaining acreage to the north and east of the existing landfill and Phases I-III. In 2002 the permit was modified to comply with Subtitle D requirements and to provide the site development details and landfill capacity of the remaining acreage (landfill cells, Sectors A-G). The site development plan allowed for the sand and gravel quarry to continue operating, but the quarry is scheduled to move towards the south and eventually east as Sectors A-G are developed.

Sector A was constructed in 2003 and has been filled since that time. The landfill was placed in an inactive status effective February 3, 2005 with only limited waste being disposed of since that time from a City of El Paso clean up project. The City of El Paso intends to re-open the McCombs Landfill at a later date.

The McCombs Landfill currently uses an alternate liner design that was approved on July 10, 1995. The approved alternate liner consists of a single 60-mil geomembrane liner overlain by a 24-inch protective soil cover. A 60-mil geomembrane is constructed over a 6-inch compacted caliche layer. This alternate liner design supercedes a previous alternative liner design (consisting of a double geomembrane liner separate by a geonet [leachate detection layer] and overlain by 24-inch leach collection system/protective cover with a minimum hydraulic conductivity of 1x10-2 cm/sec) that was approved on October 19, 1994. Landfill cells constructed prior to this time are presumably un-lined. The depth of the landfill cells at this facility are estimated to be approximately 40 to 50 feet deep. The elevation of the liner for Sectors A-G at the lowest points (leachate collection sumps) is approximately 4017 feet mean sea level (City Datum).

# 2 ASSESSMENT

## 2.1 Overview & Limitations

The scope of this project was limited to the review and analysis of available data for the McCombs Landfill. The discussions and recommendations of SHB are based on geotechnical, geological and hydrogeological conditions at the site, as described in published literature and available well records. No additional field exploration and/or testing was completed during this phase of the project. Based on past site history, climatological records, expected soil conditions and depth to groundwater, it appears very unlikely that leachate will impact groundwater. Locations for existing groundwater monitoring wells were selected on the basis of groundwater flow directions published in reviewed literature and evaluation of well data. After installation of monitor wells was complete, actual groundwater measurements on site indicated differing groundwater flow directions, necessitating installation of additional wells.

These and related limitations associated with the interpretation of results and data provided by other independent entities should be recognized in evaluating discussions and recommendations presented herein.

## 2.2 Regulatory Review

The TCEQ implemented new 30 TAC 330 Subchapter J rules governing groundwater monitoring and corrective action in 2006 (effective March 26, 2006). Per 30 TAC §330.401(b) *owners and operators of landfill units shall comply with the 2006 Revisions to this subchapter* [Subchapter J] *by applying for a permit modification with public notice in accordance with §305.70(l) of this title (relating to Municipal Solid Waste Permit and Registration Modifications) to revise any inconsistent provisions within two years from the effective date of the 2006 Revisions.* This plan has been modified to satisfy 30 TAC §330.403(a)(2), which states: *The point of compliance monitoring system must include monitoring wells installed to allow determination of the quality of groundwater passing the point of compliance as defined in §330.3 of this title and to ensure the detection of groundwater contamination in the uppermost aquifer. Monitoring well spacing for a municipal solid waste landfill unit shall not exceed 600 feet without an applicable site-specific technical demonstration that may be supplemented with a multi-dimensional fate and transport numerical flow model as set forth in subsection (e) of this section. The owner or operator of a municipal solid waste landfill unit must install a groundwater monitoring system at the point of compliance, as required by 40 Code of Federal Regulations §258.51(a)(2). When physical obstacles preclude installation of the groundwater monitoring wells at existing units,*

*the wells may be installed at the closest practicable distance to the point of compliance as defined in §330.3 of this title that will ensure detection of groundwater contamination of the uppermost aquifer.*

## 2.3 Review & Analysis of Available Data

Available information concerning the history of landfilling at the site, regional and local geology and hydrogeology was obtained and reviewed by SHB. The pertinent information is summarized in Section 4. Sources included federal, state and local agencies, as well as readily available private sector studies pertaining to local conditions and landfill operations in general. Information collected included:

- A time-lapse series of aerial photographs spanning the time from before commencement of landfilling operations at the site to the present.
- Site investigative report compiled by Danny R. Anderson Consultants (DRA), presented as part of the permit application in January, 1984 (DRA, 1984).[1]
- Documentation of permitting, inspection reporting and correspondence concerning landfilling operations received from the TDHR and the TCEQ.
- Published geologic and hydrogeologic mapping and literature available from public agencies and private/professional sources.
- Subtitle D section applicable to municipal landfills as outlined by the EPA, and the TCEQ's interpretation of the same (TAC Chapter 330).
- Data on water wells located within about 2 miles of the landfill site obtained from the Texas Water Development Board (TWDB), the TCEQ, and New Mexico State Engineers Office and the Interstate Stream Commission in New Mexico. This information included well location maps, water uses, depths to groundwater, well depths, well owners and drillers logs.
- Additional groundwater information was obtained from the Public Service Board (PSB), and the El Paso Water Utilities (EPWU).

Parkhill, Smith & Cooper, Inc. and The Carel Corporation reviewed additional data as part of the 2007 and 2012 modifications to this report. The new data from groundwater monitoring wells, groundwater contour maps, and groundwater sampling events is discussed in Section 4.7.

[1] References are listed at the end of this report.

## 2.4 Field Reconnaissance

SHB personnel completed multiple site visits during May, 1993. During the site reconnaissance, observations were made of site conditions, landfill operations, environmental conditions and general land use. Visible geologic, hydrogeologic and geotechnical conditions were studied in the open pit exposures. Groundwater wells and lysimeters on site were also visually located. Buildings, fenced areas, vegetation and land use on and around the subject site were also noted.

Parkhill, Smith & Cooper, Inc. and The Carel Corporation performed a site visit on July 16, 2007. During that reconnaissance, observations were made of current site conditions, on-site aggregate mining operations, water supply wells in the vicinity of the site and monitor wells located at the sludge disposal site, which is owned and operated by El Paso Water Utilities, located west of McCombs Road.

## 2.5 Groundwater Wells

Available information regarding groundwater wells in the site vicinity was originally reviewed and analyzed by SHB. Well information from TCEQ files was collected for wells located within a two-mile radius of the project site by Agency Information Consultants (AIC, 1993). Additional data was collected from El Paso Water Utilities (EPWU) and the New Mexico State Engineers Office (NMSEO). Many of the water wells in the project vicinity are EPWU public water supply and recharge wells. Groundwater flow maps and hydrographs of selected wells were constructed in an effort to analyze hydrologic conditions in the area. Regional hydrologic conditions and local well data are further discussed in Sections 4.5 and 4.6, respectively. Site-specific groundwater information in provided in Section 4.7.

# 3 REVIEW OF PREVIOUS INVESTIGATION

The initial permit application for the McCombs Landfill was completed by DRA on behalf of the City. The permit application addresses site characteristics, and includes discussions of the types of wastes to be accepted, and presents pertinent operational and maintenance criteria. Subsurface investigations completed on site were presented in a report that was appended to the permit application.

Certain limitations exist in the interpretation of results and data provided by other independent entities.

## 3.1 Geotechnical Investigation Data

This section primarily focuses on the subsurface investigations and the geotechnical profile of the soils underlying the site as described by DRA (1984).

- **Subsurface Drilling:** DRA completed 8 test borings west of the then existing landfill between September, 1982 and January, 1983, to depths between 30 and 50 feet below existing grades. Fifteen additional borings were drilled to 60 feet at locations to the east and north of the landfill. All drilling by DRA was completed using a Mobile B-52/61 and 8-inch diameter hollow stem auger. The geotechnical investigation report prepared by DRA also includes logs of 6 borings previously completed by Dickenson Laboratories to depths of 50 feet north of the landfill.

- **Geotechnical Profile:** The original 8 borings completed by DRA were drilled within an existing sand and gravel pit. The soils encountered predominantly were relatively clean sands, interbedded with lesser amounts of silty sands and occasional layers of clayey sands and sandy clays. Relatively clean sands with varying silt and gravel contents were noted in the 15 additional borings completed by DRA. The surface elevations of these 15 borings is unknown. In the 6 borings drilled by Dickenson, clayey sands were encountered to depths ranging between 13 and 25 feet, underlain by relatively clean sands. In one of the 6 borings, however, clean sands were encountered for the entire depth of the boring.

  In general, the relatively clean and silty sands are non-plastic, while the clayey soils range from low to high in plasticity. No groundwater was reported in any of the borings drilled. Permeability tests were not considered necessary, based on the soil types encountered. DRA estimated a coefficient of permeability to be between 0.01 and 0.04 cm/sec.

The report includes recommendations for temporary and permanent slopes, and for fill material to be used for site grading. Recommendations and specifications for other earthwork elements of the project were also addressed.

## 3.2 Permit Application Data

Pertinent information, including site characteristics and solid waste data was provided along with the permit application. Design criteria such as engineering considerations, land use, ground and surface water protection, etc. were also addressed. This information is briefly summarized below:

- **Solid Waste Data:** The landfill was located to serve the northeast parts of El Paso with an estimated population of approximately 77,500. The facility was designed to accept approximately 162 tons of non-hazardous industrial, municipal, commercial and domestic waste per day. Based on current estimates however, the landfill accepts about 220 tons of domestic waste per day. City personnel have indicated that the landfill does not accept industrial or commercial waste.

- **Site Location & Land Use:** The location of the site was defined as "...approximately 20 miles northeast of downtown El Paso in Section 6, Block 80, Township 1." Land use within a one mile radius included the existing landfill, a sand quarry, and some commercial operations. The nearest airfield reportedly was a privately owned sail plane airfield located approximately 2.3 miles from the site. The report states that "...an Eastern Boundary Fault Zone exists between the Franklin Mountains and the Hueco Bolson deposits.", and "...assuming continuous movement this (movement of the fault) would equate to approximately 0.005 inches per year" (DRA, 1984).

- **Groundwater Protection:** According to the DRA report attached to the permit application, unconfined groundwater occurs beneath the land surface of the Hueco Bolson at depths ranging between 260 and 360 feet. The water table reportedly has a hydraulic gradient of about 0.025 "...toward a major cone of depression in the vicinity of the El Paso International Airport." The report states that there is a steady increase in the total dissolved solids (TDS) with increasing depth. An inventory of existing water wells in the vicinity of the site also was completed.

  According the DRA report, the landfill would not pose a significant risk to groundwater underlying the site. The report states that "...soil moisture storage is always below available water holding capacity so gravity percolation is impossible." The report further states that the cemented soils and clay lenses underlying the site will also inhibit downward movement of leachate generated in the landfill units. The report points out that the then existing landfill had not caused a deterioration in groundwater quality, since important constituents from landfill leachate including BOD, COD, iron, manganese, chlorides, nitrates, hardness and trace elements were not detected in the wells located downgradient from the site.

- **Miscellaneous Information:** The DRA report addressed other subjects such as daily operational procedures, utility corridors within the site, surface water issues, and controlling methane generated in the landfill units. Discussions of site access were also included. These points are not further discussed herein.

# 4 SITE CONDITIONS & HISTORY

## 4.1 Site History

Available historical information was originally reviewed by SHB to assist in evaluating conditions on and in the vicinity of the site. The review included a brief evaluation of prior site usage. Particular attention was paid to past and current landfilling operations. Information reviewed included data available from federal, state, city and private agencies. Persons familiar with the site and landfilling operations were contacted for additional site information. Additional site history information has since been provided by the City of El Paso.

Prior to landfilling operations, the site was owned by Prices Producer, Inc. The City of El Paso purchased the property from Prices in September, 1954. The site was subsequently leased to El Paso Sand Products Inc. to be used for aggregate mining and was later leased to Jobe Concrete Products. Quarrying operations continued to date on site through a lease with Cemex.

The McCombs Landfill was first permitted as a Type I landfill by the Texas Department of Health Resources (TDHR) in August, 1976. According to City personnel, landfilling operations commenced in 1960. This initial permit was issued in 1976 for an area of 25 acres and a waste volume of approximately 400 tons per day. In May, 1984, the permit was amended to cover a total area of approximately 327 acres.

## 4.2 Climate

Weather information was collected from the National Oceanic and Atmospheric Administration (NOAA, 1993) by SHB. Based on this information, the climate of the El Paso region is characterized by an abundance of sunshine throughout the year, high daytime temperatures with very low humidity, scanty rainfall, and a relatively mild winter season typical of arid areas at low latitudes. Summer temperatures are high, frequently above 90 degrees and occasionally above 100 degrees. Humidity generally ranges between 10 and 25 percent. Winter daytime temperatures are mild, rising to 55 to 60 degrees on the average.

Rainfall throughout the year is light and generally insufficient for any plant growth except desert vegetation. Most of the precipitation occurs between July and September, from short but heavy thunderstorms. Small amounts of snowfall occur almost every year, but accumulations rarely exceed one inch, and snow seldom remains on the ground for more than a few hours. Average annual rainfall and snowfall are approximately 8.5 and 5.2 inches, respectively. Total annual precipitation varies from approximately 8 to 12 inches per year.

Wind velocities are not excessively high. Prevailing winds are from the north in the winter and south in summer, with the prevailing direction for the year north by a small margin.

## 4.3 Topography

The original topography of the site was presumably hilly. However, subsequent quarrying and landfilling operations have significantly modified the natural contours of the site. The present topography is now dominated by large depressions which are remnants of the old quarrying operations. These excavations range up to 50 feet in depth. The elevated landfilled areas are built-up to elevations in excess of 50 feet above grade. Earthen berms surrounding the landfill reduce the potential for run-on from adjacent properties.

## 4.4 Geologic Setting & Soil Profile

The McCombs Landfill lies within the Rio Grande Rift portion of the Mexican Highlands section of the Basin and Range Physiographic Province (Fenneman, 1931; Thornbury, 1965). Thornbury (1965) defines the Mexican Highlands Section as an area of variable geologic structure characterized by high desert valleys and mountain ranges. Hawley (1975) subdivided the Mexican Highlands Section into the Bolson and Rio Grande subsections. The Bolson Subsection covers a large area of southwestern New Mexico and portions of Texas, Chihuahua, Mexico and Arizona. This region is characterized by broad intermontane basins with internal drainage, called bolsons, that are bounded by fault-block mountain ranges.

The mountain ranges on the eastern side of the Bolson subsection trend in a general north-to-northwest direction and typically flank sizeable basins, including the Hueco Bolson in which the site is located (Thornbury, 1965). The Rio Grande Valley is incised into thick deposits of basin fill at the southern end of the Hueco Bolson typically ranging in age from Pliocene to Holocene. A broad alluvial plain with gently sloping terraces characterizes the valley of the Rio Grande River.

Tectonic adjustment initiating basin formation began in the region in the early Miocene. As the basins developed, erosion and subsequent deposition of Santa Fe Group sediments occurred (Gile and others, 1981; Strain, 1966). Renewed faulting in Late Miocene and Pliocene time, coupled with continued relative uplift, produced a series of en echelon grabens, such as the Mesilla and Hueco Bolsons, that characterize this section of the Rio Grande Rift Valley. These bolsons

regionally have received several thousand feet of sediments during the Late Cenozoic (Strain, 1966).

Basin fill was initially derived from the surrounding mountains. During the Pleistocene, the ancestral Rio Grande River flowed into closed basins in the area depositing thick sequences of sediments and forming an ephemeral lake (Strain, 1969). This basin fill has been correlated with similar deposits in other sections of the Rio Grande Rift and is named the Santa Fe Group by Hawley and others (1969). It has been proposed that the sediments of the Hueco Bolson be included in the Santa Fe Group, based on similar composition and depositional history.

The Hueco Bolson deposits have been divided into two rock stratigraphic units by Strain (1966), the Fort Hancock Formation and the Camp Rice Formation. The older Fort Hancock Formation is a massive unit composed of poorly consolidated clays, silts and fine grained sands ranging in color from grayish red to brown (Strain, 1966, 1980). The persistent and essentially horizontal bedding and fine texture of the Fort Hancock Formation indicates that it was deposited in lacustrine and playa environments. Goebel and others (1987) hypothesized deposition of the Fort Hancock Formation on a low-relief basin floor with a highly sinuous meandering river and ephemeral lakes.

In early Pleistocene time, adjacent basins had aggraded to levels sufficient to coalesce with the Hueco Bolson. Periods of moderately high precipitation resulted in the formation of a large ephemeral lake system which Strain (1966) named Lake Cabeza de Vaca. This ancient lake covered an area from Mesilla Bolson, more than 50 miles northwest of the site, to the Red Light Bolson, south of Sierra Blanca.

Deposition of fine grained sediments in the Hueco Bolson continued until an outlet to the southeast formed in early Pleistocene time. This outlet essentially breached Lake Cabeza de Vaca and changed the depositional environmental from predominantly lacustrine to fluvial (Strain, 1980). The Camp Rice Formation (Strain, 1966) records continued fluvial aggradation by the ancestral Rio Grande River in the Hueco Bolson.

The Camp Rice Formation unconformably overlies the Fort Hancock Formation. It is primarily composed of gravel, sand, silt and occasional discontinuous lenses of volcanic ash. Its color varies from very light gray to shades of pink, orange and light brown. The Camp Rice Formation is composed of two basic subdivisions, a fluvial and a piedmont facies (Gile and others, 1981). The fluvial facies is chiefly sandy to pebbly river-channel deposits with subordinate fine-grained overbank units. This facies thickens toward the bolson axes and commonly wedges out against the piedmont facies. The permitted area is probably underlain by fluvial deposits of the Camp Rice Formation (Seager and others, 1987).

Termination of Camp Rice deposition probably occurred as a result of spillover from the upper reaches of the Rio Grande River or stream capture by an arroyo system draining the Hueco Bolson. The upper reach of the Rio Grande River in the Mesilla Bolson was thus joined to the Rio Conchos through El Paso Canyon in mid-Pleistocene time (Strain 1970; Hawley and

Kottlowski, 1969). Integration of the upstream and downstream reaches of the Rio Grande River, re-establishing through-flowing drainage, was apparently the major cause of subsequent valley incision (Johnson and others, 1984).

The timing of this key shift from basin aggradation to incision is not precisely known, but can be estimated reasonably well from dated units within and overlying the Camp Rice Formation, and from subsequent development of geomorphic surfaces and soils (Gile and others, 1981; Machette, 1985). After the establishment of an integrated Rio Grande in mid-Pleistocene time, large-scale aggradation of the bolsons ceased. Several cycles of accelerated river downcutting followed, separated by periods of relative stability. This Quaternary history is expressed morphologically as a series of terrace, alluvial fan and pediment surfaces cut into or deposited upon the Santa Fe Group (Kottlowski, 1958). These surfaces are locally modified by recent sand deposits.

Numerous fault scarps of Quaternary age are present in the Hueco Bolson near the landfill. One inferred scarp apparently traverses the northeastern quadrant of the landfill permit area (SHB, 1993). This fault was not identified on the geologic map prepared by Harbour (1972). Insufficient information is available to confirm or refute the presence of a fault. Other north-south trending scarps are also apparent in the area. The age of faulting in Hueco Bolson has been dated as less than 0.5 m.y., based on offset in the Camp Rice Formation and in soils formed on the Camp Rice Formation (Seager, 1980). More precise dating of the faults has not been performed.

As noted previously, the McCombs Landfill is located on deposits of the Hueco Bolson, probably Camp Rice Formation. These deposits primarily consist of clay, sand and gravel, with some caliche (Bureau of Economic Geology, 1983). The landfill site is underlain by Tertiary and Quaternary basin (bolson) deposits, overlain by areas of gravel and caliche rimrock as presented in Figure 3 (Harbour, 1972). Recent Quaternary alluvial deposits are also present in the landfill vicinity in topographically low areas.

The caliche rimrock of Pleistocene age is commonly two to four feet thick, and consists of angular fragments of bedrock derived from the mountains and cemented by white caliche. The bolson deposits in the area were described by Harbour (1972) as "friable white sand with rounded volcanic pebbles". Bolson deposits of clay and sand with some gravel and caliche have been observed in water wells drilled east of the Franklin Mountains. The bolson deposits have been documented to extend to a depth of at least 4,920 feet below ground surface in a well drilled south of Newman, New Mexico, approximately five miles east of the landfill (Harbour, 1972).

A soil investigation was performed in 1983 by DRA. During the investigation, numerous soil borings were drilled on site to a depth of 60 feet below ground surface. According to boring logs generated during the investigation, the soils consist of an upper zone of variable thickness of silty sand, underlain by deposits of clean and gravelly sands. Stringers of clay which did not appear to be laterally extensive were observed in some of the soil borings. The sands and gravelly sands appear to be lenticular in nature, with little correlation across the site.

## 4.5 Regional Hydrogeology

Published information on the hydrogeology of the site area was reviewed to evaluate the factors influencing the groundwater system at the site. The regional groundwater system in the area primarily consists of the Hueco Bolson aquifers.

The Hueco Bolson has been divided into the City Artesian area, the Mesa area and the Lower Valley (Leggat, 1962). The City Artesian area underlies downtown El Paso and east El Paso as far as Ysleta. The Mesa area extends north of the City Artesian area into New Mexico and east to the Hueco Mountains. The Lower Valley area parallels the Rio Grande, and extends from Ysleta to beyond Tornillo. The McCombs Landfill is located in the Mesa area.

In general, the groundwater regimes of the City Artesian and the Lower Valley areas are essentially the same. Two aquifers occur in these areas: an upper aquifer in the Rio Grande alluvium and a lower aquifer in the Hueco Bolson deposits. Since no known impermeable zone of regional extent separates these aquifers, the Rio Grande alluvium and the Hueco Bolson are considered to be, at least in part, hydrologically connected in the City Artesian and Lower Valley areas (Alvarez and Buckner, 1980). Increased pumpage from public supply wells and lining of a portion of the Rio Grande River in the City Artesian area have affected the recharge-discharge relationships, and caused fluctuations in the direction of groundwater flow. In the Lower Valley area, recharge occurs from the Rio Grande Alluvial aquifer into the Hueco Bolson during times when the water level in the river is high, and from the Hueco Bolson into the Rio Grande alluvium when the water level in the river is lower.

The Mesa area primarily consists of Hueco Bolson deposits. Historic withdrawals of groundwater since 1906 for public water supply and irrigation have caused major declines in the water level. The average water level decline in the Hueco Bolson from 1903 to 1980 is approximately 53 feet (White, 1987).

Locally, recharge to the aquifer occurs due to mountain front infiltration of precipitation from the surface and from the injection of treated sewage into the aquifer from the Hueco Bolson Recharge Project (White and Sladek, 1990). Numerous injection wells have been constructed northeast of El Paso and water from the Fred Hervey Water Treatment Plant has been injected into the aquifer by El Paso Water Utilities (EPWU) since the mid-1980s. Over one billion gallons of treated water per year were injected into the Hueco Bolson between 1986 and 1991. The reinjection resulted in mounding of groundwater in the recharge project area, and has caused

some change in the groundwater flow regime. A slight mounding effect from the recharge project was observed on the EPWU 1993 Water Table Contour Map (EPWU, 1993). Since 1991, EPWU has been selling the reclaimed water to customers; thus, less water has been injected into the aquifer (Sperka, 1993) (Solis-Rojas, 2009). As of June 2009, over 60% of the reclaimed water produced at the Hervey Plant is sold to customers by the EPWU (Solis-Rojas, 2009). Selling the reclaimed water has produced a decline on water available for aquifer recharge. The recharge well nearest to the landfill is well RW11, located approximately one mile southwest of the landfill near well 49-05-214 (Solis-Rojas, 2009).

Based on available information regional groundwater flow in the McCombs Landfill area is generally to the south-southeast. However, more recent data indicates that site-specific groundwater flow is easterly as discussed in Section 4.7. Groundwater movement in the area is generally less than 1.0 feet per day (White, 1987). EPWU groundwater data indicate that the static groundwater elevation in the area is between 3670 and 3675 feet above mean sea level (msl), or approximately 370 to 390 feet below ground surface (EPWU, 1993). No evidence of perched aquifers in the area was noted during our research.

The Hueco Bolson generally contains fresh water in its upper portion and becomes saline at depth (Davis and Leggat, 1965). Groundwater quality in the landfill area is variable, with total dissolved solids (TDS) contents ranging from less than 500 ppm to greater than 1000 ppm (White, 1987). A localized plume of groundwater exhibiting elevated TDS and high nitrate values was observed in the vicinity of the former Price's Dairy Farm during the 1960s and 1970s. The Dairy was located approximately ¾-mile southwest of the permitted area. The plume probably occurred due to the leaching of salts into groundwater during excessive irrigation of crops in the area from 1956 to 1974 (White, 1987). Injection of high quality water from the Hueco Bolson Recharge Project has essentially diluted and dissipated the plume (Sperka, 1993).

## 4.6 Local Well Data

There are 41 wells located within the two-mile study area of the McCombs Landfill site according to well registration reports. The locations of the wells are shown in Figure 4. Available detailed well logs are presented in Appendix A. The wells range in total depth from 104 to 1483 feet below the local ground surface. Most of the wells are registered for public supply or industrial use. The registered wells were completed between 1940 to 2007.

Well records reviewed by SHB showed a wide range of measured groundwater depths. The variation in the recorded depths appears to be primarily due to the wide variation in measurement dates. Wells with earlier completion dates generally indicate shallower water depths than wells constructed at later dates. The location of the wells relative to the local recharge and pumping depression zones also affects the measured water depths. The recorded depth to water in the wells range from 296.6 to 385 feet below the ground surface (bgs). Depths to water in two original water wells for the quarry operations located directly west of the site were measured at 361 and 385 feet bgs. General contouring of the regional water table by SHB, considering time of measurements, is presented in Figures 5 through 8. Based on that information, groundwater

flow was originally believed to be southerly as illustrated in Figure 9. However, site specific water level data subsequently collected indicates that groundwater flow is easterly. Hydrographs of selected wells indicate a groundwater level decline in the area of approximately 20 feet in the past 20 years (Figures 10 through 13).

The nearest water wells currently used for public water supply are State Well Numbers JL-49-05-301 and JL-49-05-303 (EPWU wells 42 and 53, respectively) (Sperka, 1993). Well 303 is located approximately 1/2-mile southeast of the landfill and well 301 is located about 2/3-mile south of the site. Two wells are currently present directly adjacent to the site, State Well Numbers JL-49-05-315 located to the west and another well (CEMEX) whose State Well Number is unknown is located to the south. Both wells are owned and used by Cemex for quarrying operations. A former well, JL-49-05-314, was also located directly west of the site and was plugged and abandoned October 17, 2007. A copy of the plugging report is included in Appendix A.

## 4.7 Site Specific Groundwater Data

Supplemental site-specific hydrogeologic information was obtained and reviewed by Parkhill, Smith & Cooper, Inc. and The Carel Corporation. The supplemental information includes:

- The 2003 Groundwater Monitoring Well Installation Report by Raba Kistner. The aforementioned report details the installation activities for groundwater monitoring wells MW-1, MW-2, and MW-3.
- The geophysical logs for groundwater monitoring wells MW-1, MW-2, and MW-3 and El Paso Water Utilities wells EPWU-1, EPWU-2, EPWU-3.
- Water-level measurements were collected from groundwater monitoring wells MW-1, MW-2, and MW-3 from September 2003 to November 2007 by the City of El Paso.
- Water-level measurements from four (4) proximal groundwater monitoring wells collected by the City of El Paso in July and November 2007. The four (4) proximal groundwater monitoring wells were wells EPWU-1, EPWU-2, EPWU-3, and EPWU-4A.
- Well completion information for a water well (CEMEX) installed near the southeast corner of the site in the Spring 2007.
- Groundwater Monitoring Reports from June 2004 to July 2007.

### 4.7.1 Existing Groundwater Monitoring Wells

The existing groundwater monitoring system is comprised of monitor wells MW-1, MW-2, and

MW-3 and is illustrated in Figure 2. The boring logs for MW-1, MW-2, and MW-3 indicate the subsurface sediments are primarily composed of sand with some interbedded clay lenses and gravels. Most sands above a depth of 350 feet are described as being coarse grained and poorly sorted. Medium grained and fine grained sands appear to become more prevalent below 350 feet. The lower value of coefficient of permeability provided by Anderson (1983) is believed to be applicable to the medium and fine grained sands in the screen intervals.

The existing monitor wells have been constructed in accordance with 30 TAC §330.242, Monitor Well Construction Specifications. The logs and construction details of monitor wells MW-1 through MW-3 are provided in a December 18, 2003 Groundwater Monitoring System Installation Report by Raba Kistner (see Appendix B). Geophysical logs were also completed in monitor wells MW-1 through MW-3. The said geophysical logs are also provided in Appendix B.

### 4.7.2 September 2003 – July 2007 Water-Level Measurements

Water-levels were measured in wells MW-1, MW-2, and MW-3 from September 2003 to July 2007 by the City of El Paso. The recorded groundwater measurements are shown in the table below. Groundwater contour maps from September 2003 to July 2007 are provided in Appendix C.

**Water-Level Measurements**

| Monitor Well | MW-1 | | MW-2 | | MW-3 | |
|---|---|---|---|---|---|---|
| Top of Casing Elevation, ft msl | *4070.23* | | *4083.89* | | *4076.70* | |
| Total Well Depth from Top of Casing, ft | 475.88 | | 500.83 | | 498.02 | |
| **Measurement Date** | **WATER LEVEL DEPTH (FT) / *ELEVATION (FT MSL)*** | | | | | |
| 9/5/2003 | 396.15 | *3674.08* | 400.27 | *3683.62* | 397.71 | *3678.99* |
| 11/14/2003 | 396.29 | *3673.94* | 399.89 | *3684.00* | 391.52 | *3685.18* |
| 11/18/2003 | 396.03 | *3674.20* | 399.87 | *3684.02* | 391.25 | *3685.45* |
| 5/12/04 - 5/13/04 | 393.60 | *3676.63* | 400.58 | *3683.31* | 389.60 | *3687.10* |
| 9/27/04 - 9/28/04 | 394.10 | *3676.13* | 387.20 | *3696.69* | 390.00 | *3686.70* |
| 12/28/2004 | 394.10 | *3676.13* | 387.20 | *3696.69* | 390.00 | *3686.70* |
| 3/30/2005 | 393.00 | *3677.23* | 399.10 | *3684.79* | 389.10 | *3687.60* |
| 1/10/2006 | 393.40 | *3676.83* | 397.80 | *3686.09* | 388.90 | *3687.80* |
| 4/5/06-4/8/06 | 393.80 | *3676.43* | 397.70 | *3686.19* | 389.30 | *3687.40* |
| 7/20/2006 | 393.85 | *3676.38* | 399.02 | *3684.87* | 389.51 | *3687.19* |
| 10/31/06 - 11/2/06 | 394.65 | *3675.58* | 399.35 | *3684.54* | 390.45 | *3686.25* |
| 4/17/2007 | 394.30 | *3675.93* | 400.20 | *3683.69* | 389.90 | *3686.80* |
| 5/21/2007 | 394.10 | *3676.13* | 399.60 | *3684.29* | 389.50 | *3687.20* |
| 7/25/2007 | 394.10 | *3676.13* | 399.55 | *3684.34* | 389.70 | *3687.00* |
| 11/9/2007 | 393.74 | *3676.49* | 399.95 | *3683.94* | 389.75 | *3686.95* |
| 11/21/2007 | 393.70 | *3676.53* | 399.68 | *3684.21* | 389.86 | *3686.84* |

The above values were used to construct a hydrograph, Figure 14, to evaluate potential trends in the water-level data. The hydrograph indicates that MW-2 and MW-3 typically have comparable water-levels. The lowest groundwater elevation consistently occurred in MW-1. The initial water-levels were slightly depressed in each well; however, the elevations were stable with no major trends or fluctuations, except for the two anomalous measurements in MW-2. The anomalously high groundwater elevations recorded for MW-2 in September and December 2004 are believed to reflect an error in measurement due to the absence of a similar response in other on site monitor wells and the relatively consistent water-levels measured since that time.

Groundwater contour maps constructed from the three on site wells depict a uniformly sloping water table surface to the east-southeast as illustrated by Figure 1C through 14C in Appendix C. Review of available information revealed that four (4) additional groundwater monitoring wells exist within one-half mile west of the landfill: EPWU-1, EPWU-2, EPWU-3, and EPWU-4A. The four (4) wells were installed by the El Paso Water Utilities (EPWU) – Public Service Board to monitor a sludge disposal site located immediately west of McCombs Road and north of Stan Roberts Road. Their locations are illustrated on Figures 15, 16 and 17. Completion records and well logs are provided in Appendix A. Geophysical logs for wells EPWU-1, EPWU-2, EPWU-3 were also obtained and are included in Appendix A. Water-levels were measured in the four (4) EPWU wells on July 25, November 9, and November 21, 2007 in an effort to better define the groundwater flow direction in the vicinity of the landfill. Groundwater contour maps constructed using the July and November 2007 water-levels are provided as Figures 15, 16, and 17, respectively. These maps reveal an east to west trending low in the water table surface. According to Figures 15, 16, and 17, groundwater in the northern portion of the landfill flows southeasterly and flow in the southern portion of the site is to the northeast. Groundwater flow directions have been slightly modified following collection of additional water level measurements from August 2011 through July 2012 (see Section 4.8.1). Based on Figures 15, 16, and 17, each of the three (3) existing groundwater monitoring wells was determined to be positioned hydraulically upgradient of the landfill. However, groundwater flow data from August 2011 through July 2012 indicates existing wells MW-1 and MW-2 are downgradient of the landfill and MW-3 is upgradient of the landfill (see Section 4.8.1).

### 4.7.3 Groundwater Flow Gradient and Rate

Hydraulic gradients were estimated for the saturated zone for various points at the site from the water-level measurements recorded on November 9, 2007. The gradient for a particular part of the site is determined by calculating the difference between the groundwater contours (head difference) and dividing by the horizontal distance between the contours. The values are in ft/ft; multiply by 5,280 for the gradient in feet per mile. Minimum and maximum rates of groundwater movement were estimated using the groundwater velocity equation (Driscoll, 1986):

$v = 2{,}830Ki/ne$

Where:

v = groundwater velocity (ft/day);
K = hydraulic conductivity (cm/sec);
i = hydraulic gradient (ft/ft);
ne = effective porosity (percent); and
2,830 converts cm/sec to ft/day.

The hydraulic conductivity obtained from Anderson (1983) is estimated to be 1.0 x $10^{-2}$ cm/sec. Minimum and maximum hydraulic gradients were estimated for the saturated zone from Figure 16. Estimated hydraulic gradients range from a minimum of 0.0042 ft/ft in the south-central portion of the site, to a maximum of 0.0106 ft/ft in the southern portion of the site between MW-1 and MW-2. The average effective porosity is estimated to be 30 percent, based on values provided by Freeze and Cherry (1979).

$$v_{min} = \frac{2{,}830 \times 1.00\text{E-}02 \times 0.0042}{0.30}$$

$$v_{min} = 0.396 \text{ ft/day (easterly)}$$

and

$$v_{max} = \frac{2{,}830 \times 1.00\text{E-}02 \times 0.0106}{0.30}$$

$$v_{max} = 1.00 \text{ ft/day (northeasterly)}$$

### 4.7.4 Groundwater Quality

Groundwater monitoring results from nine groundwater sampling events conducted from May 2004 through May 2007 have been reviewed to determine if any potential groundwater impacts exist. The data indicate that of the 15 heavy metals listed in 30 TAC §330.419 only arsenic, barium and vanadium have been detected and all results for volatile organic compounds are non-detect. Some spatial variation does exist in the available data. Arsenic has been detected in MW-1 and MW-2 at concentrations below the primary drinking water standard of 10 µg/L and barium concentrations in MW-3 are elevated above those in MW-1 and MW-2. Neither arsenic or barium concentrations exhibit an increasing trend. Vanadium concentrations have been increasing in MW-2 and MW-3 since April 2005. Additionally, inorganic indicator constituents magnesium, calcium, potassium, chloride, sodium, and total dissolved solids occur at greater concentrations in MW-3 than MW-1 and MW-2. The occurrence of elevated heavy metals and inorganic indicator constituent in an upgradient well suggests that they are a natural phenomenon unrelated to the landfill. A summary of the existing groundwater analytical data for MW-1,

MW-2 and MW-3 is provided in Appendix D.

## 4.8 Piezometers PZ-4 and PZ-5

Piezometers PZ-4 and PZ-5 were installed at the McCombs Landfill in May – June, 2011 to aid in the determination of groundwater flow and to determine the extent of the point of compliance (POC). The installation report for PZ-4 and PZ-5 was submitted to the TCEQ on August 12, 2011 (PSC, 2011). Boring logs and well completion diagrams for PZ-4 and PZ-5 are provided in Appendix E. Subsurface sediments encountered during the drilling of PZ-4 and PZ-5 was primarily composed of sand with some interbedded clay lenses and gravels.

A geologic cross section trending west to east through PZ-4 and PZ-5 is included as Figure 18. Geophysical results for El Paso Water Utilities well EPWU-2 and McCombs Landfill wells MW-1 and MW-2 are also illustrated on Figure 18. Geophysical logging did not occur in PZ-4 or PZ-5. Given the interbedded nature of the sands and clays there is no discernable correlation of the stratigraphic units; however, similar variation exists in the lithologic logs and geophysical logs. The measured groundwater surface elevation on July 3, 2012 is also depicted on the geologic cross section. The groundwater surface elevation is generally level with a slight decreasing trend from EPWU-2 through MW-1. A noticeable decrease in groundwater surface elevation occurs between MW-1 and PZ-4. This observable decrease is likely due to drawdown induced by the extraction well (i.e. CEMEX well) located south of the facility and north of Stan Roberts Road.

### 4.8.1 August 2011 Through July 2012 Water Levels

Monthly water-levels were measured in El Paso Water Utilities wells EPWU-1, EPWU-2, EPU-3, and EPWU-4A; McCombs Landfill wells MW-1, MW-2, MW-3; and piezometers PZ-4 and PZ-5 from August 2011 through July 2012 by the City of El Paso. The recorded groundwater measurements are provided in Table 2. The values in Table 2 were used to construct a hydrograph, Figure 19, to evaluate potential trends in the water-level data. Groundwater elevations in all wells and each piezometer were generally stable from month to month aside from noticeable decreases in PZ-4 over the first two (2) months of measurements. The observable drawdown in PZ-4 was believed to be induced by the extraction well (i.e. CEMEX well) located south of the facility and north of Stan Roberts Road.

Groundwater contour maps from August 2011 through July 2012 are provided in Appendix F (Figures F1 through F12). These maps reveal a predominant easterly to southeasterly flow direction. A northwesterly component of groundwater flow is apparent in the southwest corner of the landfill; however, the flow changes to the east and southeast are believed to be due to drawdown induced by the extraction well (i.e. CEMEX well) located south of the facility and north of Stan Roberts Road. Based on the groundwater contour maps in Appendix F, MW-1 and

MW-2 are downgradient of the landfill and MW-3 is upgradient of the landfill.

# 5 CONCLUSIONS

Findings of the hydrogeologic evaluations of the McCombs Landfill are summarized below:

- According to information provided by a soil investigation report prepared by DRA, the soil underlying the site predominantly consists of sand with varying silt and gravel contents, and occasional layers of sandy clay. These soils typically are associated with the Pleistocene age Camp Rice Formation.

- Groundwater underlying the site occurs in the Hueco Bolson and Rio Grande Alluvial aquifers. Based on published information, the depth to groundwater at the landfill varies between 370 and 390 feet.

- Regional groundwater flow direction is generally toward the south-southeast.

- Climate in the El Paso region is characterized by an abundance of sunshine, low annual rainfall and high rates of evaporation.

- Climatic conditions indicate a low potential for leachate generation and migration to groundwater at the McCombs Landfill.

- The boring logs for MW-1, MW-2, and MW-3 indicate the subsurface sediments are primarily composed of sand with some interbedded clay lenses and gravels. Most sands above a depth of 350 feet are described as being coarse grained and poorly sorted. Medium grained and fine grained sands appear to become more prevalent below the 350 foot depth.

- Groundwater elevations recorded for the landfill since 2003 are stable and do not indicate any major trends or fluctuations.

- The estimated groundwater velocity for the uppermost water-bearing zone is about 1.0 feet per day.

- Spatial variability is apparent in the groundwater data with arsenic, barium, vanadium, magnesium, calcium, potassium, chloride, sodium, and total dissolved solids occurring at greater concentration in MW-3 than in MW-1 or MW-2.

- Groundwater flow at the McCombs Landfill is predominantly to the east/southeast. A northwesterly component of groundwater flow is apparent in the southwest corner of the landfill; however, the flow changes to the east and southeast likely due to the drawdown induced by the extraction well (i.e. CEMEX well) located south of the facility and north of Stan Roberts Road. MW-1 and MW-2 are downgradient of the landfill and MW-3 is upgradient of the landfill.

# 6 REVISED GROUNDWATER MONITORING SYSTEM

The TCEQ implemented new 30 TAC 330 Subchapter J rules governing groundwater monitoring and corrective action in 2006 (effective March 26, 2006). Per 30 TAC §330.401(b) *owners and operators of landfill units shall comply with the 2006 Revisions to this subchapter* [Subchapter J] *by applying for a permit modification with public notice in accordance with §305.70(l) of this title (relating to Municipal Solid Waste Permit and Registration Modifications) to revise any inconsistent provisions within two years from the effective date of the 2006 Revisions.*

## 6.1 Proposed Groundwater Monitoring System

The McCombs Landfill will comply with 30 TAC §330.403(a)(2) by modifying the ground water monitoring system appropriately. The McCombs Landfill will utilize the ground water monitoring system to monitor the uppermost groundwater in accordance with 30 TAC §§330.403-407 to protect human health and the environment.

The proposed groundwater monitoring system was based on the potentiometric surfaces illustrated on the groundwater contour maps provided in Appendix F. As previously discussed, the maps were constructed using water-level data collected from August 2011 to July 2012. The proposed groundwater monitoring system will be comprised of nine (9) monitoring wells: MW-1A, MW-2A, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, and MW-9. This will be done by plugging and abandoning existing wells MW-1 and MW-2, retaining existing well MW-3, converting existing piezometers PZ-4 and PZ-5 to MW-4 and MW-5, and installing new wells MW-1A, MW-2A, MW-6, MW-7, MW-8, and MW-9. It is proposed that monitoring wells MW-1A, MW-2A, and MW-6 through MW-9 be installed within 180 days of the approval date of this permit modification. Monitoring wells MW-1 and MW-2 will be plugged and abandoned, but will remain a part of the POC until background has been established in wells MW-1A and MW-2A, respectively. Five (5) additional monitoring wells (MW-10, MW-11, MW-12, MW-13, and MW-14) may also be added to the facility groundwater monitoring system in the event the landfill constructs cells in Sectors B, C, D, and E. Well MW-10 would be installed prior to acceptance of waste in Sector B. Wells MW-11 and MW-12 would be installed prior to acceptance of waste in Sector C. Wells MW-13 and MW-14 would be installed prior to waste acceptance in Sector D. If the sequence of landfill sector development changes, the phasing of well installations for MW-10, MW-11, MW-12, MW-13, and MW-14 will be adjusted accordingly as needed to ensure that POC wells will be in place before waste is accepted in a sector. Existing and proposed monitoring wells, the POC, and landfill Sectors are depicted on Figure 20.

Proposed wells MW-1A, MW-2A, MW-4, MW-5, MW-6, MW-7, MW-8, and MW-9 will be

located at the POC (*i.e.,* the vertical surface no more than 500 feet from the hydraulically downgradient limit of the waste management unit boundary, extending down through the uppermost ground water underlying the regulated units, and located on land owned or operated by the McCombs Landfill). Existing well MW-3 will be a background (i.e., upgradient well). Wells MW-10, MW-11, MW-12, MW-13, and MW-14 will also be located at the POC in the event their installation is required. If physical obstacles preclude installation of the groundwater monitoring wells at proposed locations in the existing sectors, the wells will be installed at the closest practical distance hydraulically downgradient from the relevant point of compliance that will ensure detection of groundwater contamination. The design of the monitoring system was based on site-specific technical information. Certification of the system is provided as Appendix G.

The proposed groundwater monitoring wells, with corresponding piezometer numbers (where applicable), and hydraulic gradient positions are listed in the following table.

**Proposed Groundwater Monitoring System**

| Monitoring Well ID | Status | Gradient Position | Latitude and Longitude* | Total Well Depth (ft)** | Top of PVC Casing Elevation (ft MSL)** | Screen Interval Depths (ft)** | Screen Interval Elevations (ft. MSL)** |
|---|---|---|---|---|---|---|---|
| MW-1 | Existing (To be plugged and abandoned) | POC | N 31°59'00.64" W 106°24'14.07" | 473 | 4,070.23 | 461 to 473 | 3,606.35 to 3,594.35 |
| MW-1A | New | POC | N 31°59'17.96" W 106°24'14.51" | 416 | 4,070 | 396 to 416 | 3,671 to 3,651 |
| MW-2 | Existing (To be plugged and abandoned) | POC | N 31°59'00.54" W 106°24'25.57" | 498 | 4,083.89 | 478 to 498 | 3,603.06 to 3,583.06 |
| MW-2A | New | POC | N 31°59'17.85" W 106°24'26.02" | 424 | 4,084 | 404 to 424 | 3,677 to 3,657 |
| MW-3 | Existing | Background | N 31°59'43.41" W 106°24'13.34" | 495 | 4,076.70 | 475 to 495 | 3,598.68 to 3,578.68 |
| PZ-4 | Existing (Convert to MW-4) | POC | N 31°59'18.82" W 106°24'07.71" | 465 | 4,049.64 | 413 to 463 | 3,634.28 to 3,584.28 |
| PZ-5 | Existing (Convert to MW-5) | POC | N 31°59'29.27" W 106°23'53.85" | 440 | 4,061.05 | 418 to 438 | 3,640.44 to 3,620.44 |
| MW-6 | New | POC | N 31°59'17.90" W 106°24'21.29" | 408 | 4,067 | 388 to 408 | 3,676 to 3,656 |

## Proposed Groundwater Monitoring System (continued)

| Monitoring Well ID | Status | Gradient Position | Latitude and Longitude* | Total Well Depth (ft)** | Top of PVC Casing Elevation (ft MSL)** | Screen Interval Depths (ft)** | Screen Interval Elevations (ft. MSL)** |
|---|---|---|---|---|---|---|---|
| MW-7 | New | POC | N 31°59'18.57" W 106°24'0.75" | 462 | 4,065 | 412 to 462 | 3,650 to 3,600 |
| MW-8 | New | POC | N 31°59'18.93" W 106°23'53.86" | 443 | 4,071 | 423 to 443 | 3,645 to 3,625 |
| MW-9 | New | POC | N 31°59'23.93" W 106°23'53.78" | 443 | 4,071 | 423 to 443 | 3,645 to 3,625 |
| MW-10 | Potential (Install if landfill expands to Sector B)*** | POC | N 31°59'35.15" W 106°23'53.83" | 446 | 4,080 | 426 to 446 | 3,651 to 3,631 |
| MW-11 | Potential (Install if landfill expands to Sector C)*** | POC | N 31°59'41.04" W 106°23'54.00" | 441 | 4,079 | 421 to 441 | 3,655 to 3,635 |
| MW-12 | Potential (Install if landfill expands to Sector C)*** | POC | N 31°59'46.93" W 106°23'54.00" | 433 | 4,076 | 413 to 433 | 3,660 to 3,640 |
| MW-13 | Potential (Install if landfill expands to Sector D)*** | POC | N 31°59'52.81" W 106°23'54.12" | 416 | 4,064 | 396 to 416 | 3,665 to 3,645 |
| MW-14 | Potential (Install if landfill expands to Sector D)*** | POC | N 31°59'58.70" W 106°23'54.16" | 406 | 4,059 | 386 to 406 | 3,670 to 3,650 |

* - Locations of new and potential wells may be adjusted based on site conditions at time of drilling. 600 foot spacing will be maintained.
** - Depths and elevations for new and potential wells are estimated.
*** - If the sequence of landfill sector development changes, the phasing of well installations will be adjusted accordingly as needed to ensure that POC wells will be in place before waste is accepted in a sector.

The new monitoring wells will be installed by a Texas licensed monitoring well driller in accordance with TCEQ monitoring well specifications. They will be completed in a manner not to introduce contaminants. The monitoring well installation and development be supervised by a geologist or engineer who is familiar with the area geology. Anticipated construction details for the new wells are provided in the table on the following page:

## Well Construction Specifications

| | |
|---|---|
| Well Depths | All wells approximately 25 feet into saturated zone, except MW-7. MW-7 installed approximately 55 feet into saturated zone to account for CEMEX well drawdown |
| Well Materials | 4" diameter sched. 80 PVC, flush threaded with screw joints, and o-rings. |
| Screen | MW-7 - Approximately 50 ft section, machine slotted with 0.010" slots.<br>All other wells - Approximately 20 ft section, machine slotted with 0.010" slots. |
| Filter Pack | Inert 10/20 silica sand extending approx. 2 ft above top of screen. |
| Annular Seal | 30 ft thick, composed of hydrated sodium bentonite pellets or granules. |
| Casing Seal | Bentonite grout or cement-bentonite grout placed from the annular seal to within approximately 2 ft. of the surface. |
| Concrete Pad | A 4' x 4' x 6" reinforced concrete pad extending to grout below surface. |
| Protective Casing and Bollards | Four-inch steel locking protective casing and two bollards placed outside of concrete pad. |

Note: Well depths may vary based on field conditions and the actual elevation of the groundwater producing interval encountered during drilling.

# LOG OF PIEZOMETER NO. PZ-4

Project Description: 2011 McCombs Landfill Piezometer Installations

CAREL CORPORATION

Location: McCombs Landfill
Top of PVC El.: 4049.64 feet MSL
Surface El.: 4047.28 feet MSL
Completion Depth: 466 feet
Date Boring Started: 5/26/2011
Date Boring Completed: 6/2/2011

Latitude: 31.988560
Longitude: 106.402142

| Depth, feet | Samples | Symbol/USCS | MATERIAL DESCRIPTION | Piezometer Construction Details | Piezometer Description |
|---|---|---|---|---|---|
| 0–5 | | | SAND, tan, well graded, subangular to angular, fine to cobble grained, dry, loose, some gravel, carbonate cement | | Concrete from surface to 2' bgs |
| 5–10 | | | | | |
| 10–15 | | | SAND, light grayish red brown, well graded, round to subangular, fine to pebble grained, dry, loose, some gravel, some volcanic rock fragments, quartz rich with mafic gravel and volcanic rocks, multicolored grains | | |
| 15–20 | | | | | |
| 20–25 | | | SAND, light reddish brown to brown, poorly graded, rounded, fine grained, dry, loose, quartz rich with mafic minerals, multicolored grains | | |
| 25–30 | | | | | |
| 30–35 | | | | | |
| 35–40 | | | | | |
| 40–45 | | | SANDY GRAVEL, light brown, well graded, round to angular, fine to gravel grained, dry, loose, quartz rich with mafic minerals, multicolored grains | | |
| 45–50 | | | | | |
| 50–55 | | | SAND, dark brown, well graded, fine to pebble grained, dry, loose, and gravel, iron oxide staining, quartz rich with multicolored grains | | |
| 55–60 | | | | | |
| 60–65 | | | SAND, light grayish brown, well graded, round to subangular, fine to pebble grained, dry, loose, and gravel, with volcanic rock fragments, with limestone, quartz rich with multicolored grains | | |
| 65–70 | | | | | |
| 70–75 | | | SAND, light brown, well graded, dry, loose, and gravel, quartz rich with mafic minerals, multicolored grains | | |
| 75–80 | | | | | |
| 80 | | | CLAY, reddish brown, dry | | |
| 80–85 | | | SAND, light brown, well graded, subrounded, fine to medium grained, dry, loose, iron oxide staining, quartz rich with mafic minerals, multicolored grains | | |
| 85–90 | | | | | |
| 90–95 | | | SAND, light brown, well graded, fine to pebble grained, dry, loose, and gravel, quartz rich with mafic minerals, multicolored grains | | |
| 95–100 | | | | | |

Permittee or Site Name: McCombs Landfill
County: El Paso County
Date of Monitor Well Installation: June 1, 2011
Latitude: 31°59'18.81720" Longitude: 106°23'53.84750"
Monitor Well Groundwater Gradient Position:
Upgradient: _____ Downgradient: _____

MSW Permit No.: 729A
Monitor Well I.D. No.: PZ-4
Date of Monitor Well Development: June 8, 2011
Monitor Well Driller
Name: William B. Bludworth
License No. 4885

NOTES:

- Report all depths from Surface Elevation and all Elevations relative to Mean Sea Level (MSL), to nearest hundredth of a foot.
- Diameter of boring should be at least 4 inches larger than diameter of well casing.
- Use flush screw joint casing only, 2-inch diameter or larger, with o-rings or PTFE tape in joints (4-inch diameter recommend).
- Well development should continue until water is clear, and pH and conductivity are stable.

Geologist, Hydrologist, or Engineer Supervising Well Installation: Michael J. Hull, PG
Static Water Level Elevation (with respect to MSL) after Well Development: 3,650.81' MSL
Name of Geologic Formation(s) in which Well is completed: Hueco Bolson

## Memorandum

SAIC

To: TCEQ

From: Randall J. Sippel, P.G., SAIC

Subject: Water Well Search

Date: July 9, 2012

SAIC Energy, Environment & Infrastructure, LLC has conducted a water well search for the McCombs Landfill located in El Paso County, El Paso, Texas in accordance with 30 TAC §330.63(e)(3)(J). The water well search was conducted utilizing the online Texas Water Development Board (TWDB) Water Information Integration and Dissemination (WIID) database. Site coordinate boundaries were entered into the database (buffer numbers 1 through 4) and a 2-mile boundary was placed on the buffer numbers (see attached figure). All scanned well logs located within the approximate 2-mile radius were downloaded from the TWDB website and are included as an attachment to this memo. The scanned quality of the documents is as they were located on the TWDB website and are considered the best version available. The wells located within the search radius include the following:

**Table 1**

**Water Well Search**

| | | | | |
|---|---|---|---|---|
| 4905201 | 4905202 | 4905203 | 4905204 | 4905205 |

Landfill, MSW Permit No. 729A. The Water Well Search map, Figure 4 and Water Well Inventory, Table 1, of that letter are also provided with the TWBD well logs. In addition to the wells listed above, well sealing and redrilling records for the Cemex replacement well (2007) is located in the attachment.
